PILOT'S INFORMATION MANUAL

P/N DMHPIPYEEN - Edition 1 - Revision 3

▲ CAUTION ▲

This information manual is a non-official copy of the pilot's operating handbook and may be used for general information purposes only. It is not kept current and therefore cannot be used as a substitute for airworthiness authorities approved manual which is the only one intended for operation of the airplane.

The content of this document is the property of SOCATA S.A.S. It is supplied in confidence and commercial security of its contents must be maintained. It must not be used for any purpose other than that for which it is supplied, nor may information contained in it be disclosed to unauthorized persons. It must not be reproduced nor transmitted in any form in whole or in part without permission in writing from the owners of the Copyright.

Information in this document is subject to change without notice.

Applicability of your handbook

The POH in the airplane at the time of delivery contains information applicable to model TBM airplane designated by the serial number and registration number shown on approval page of this POH.

This information is based on data available at the time of publication.

For any POH and / or supplement order, it is necessary to mention their part number.

POH and supplement part numbers

A POH, which part number is "T00.DMxFMxxxx", consists of a basic part which has its own part number (sections 0 to 8), and of supplements, each one bearing a particular part number.

Each supplement looks like a small POH.

The part number in the form of "DMxFMxxxxxxxxx" is the number noted on the first page of the "List of effective pages and validities", either of the basic POH or of each supplement.

Each part number corresponds to an airplane model, a version and a revision of the POH or a supplement.

POH updates

Revisions

Modifications and/or additions to the POH and supplements will be covered by revisions published by the manufacturer and approved by certification authorities.

The revisions of the POH or its supplements lead to a modification of its part number (DMxFMxxxEXR0XX) which becomes :

DMxFMxxxEXR1XX for revision 1,DMxFMxxxEXR1AXX for revision 1A,

DMxFMxxxEXR2XX for revision 2,

DMxFMxxxEXR3XX for revision 3 and so on...

▲ CAUTION ▲

It is the responsibility of the owner to maintain this POH in a current status and incorporate successive revisions.

Normal update (Rev. 1, Rev. 2, Rev. 3 and so on...)

The new list of effective pages published for each revision permits the determination of those pages to be deleted or inserted into the POH. Pages bearing the latest revision number shall be inserted into the POH.

During an updating of a specific POH (allocated to the airplane serial number), a personalization can be done in function of the applicability of some pages in accordance with the airplane serial numbers and/or the modifications applied (or not applied) to the airplane.

The list of modifications is available for consultation on mysocata.com website.

NOTE •

The list of the modifications, which have been applied on each airplane at the factory, is recorded in the I.I.R. (Individual Inspection Record). The list of the modifications applied as a retrofit during airplane life is recorded in the airplane logbook, page X or XI.

•

Temporary update (TR 01)

Temporary revisions (TR 01, TR 02, etc...) are issued on yellow pages and their part number is modified as follows: RX becomes TXX.

example : DMxFMxxxxxT01xx

These pages shall be inserted into the POH as a complement to the existing white pages.

The interim yellow pages bear the same page numbers as their white counterparts and, instead of the revision number, the mention "TR XX - DATE XX".

The modified white pages are kept in the POH, however the information in the yellow pages supersedes the information in the existing white pages.

The appropriate white pages are replaced and the yellow pages are withdrawn at the time of the regular revision.

Identification of updates

Additions or changes to the existing text are indicated with a black vertical line in the page margin, next to the affected text.

When technical modifications require text left intact to be transferred onto one or several different page(s), a black vertical line appears in the margin of the page(s) concerned, next to the revision number.

When major technical modifications cause significant modifications to the existing text, a black vertical line appears over the full text length.

If an illustration is modified or added, it is indicated with a black vertical line in the margin next to the modified area.

If technical modifications result in the creation of a new text or drawing on a new page. a black vertical line appears over the full text or drawing length, next to the revision number

POH editions

Editions enable to validate the whole handbook or supplement(s) further to important modifications and/or technical improvements on the concerned model (example: new fuel system, new flight deck, ...). To a new edition corresponds a new airplane validity and a new part number.

Warning, caution, note and remark

The text in this POH sometimes includes

NOTF •

RFMARK ·

mentions associated with the practices to be performed.

These additional mentions highlight or emphasize important points.

▲ WARNING ▲

Draws the attention to points to be strictly observed and addresses the use of products, processes, methods, practices or limitations to avoid risks of personal injury or loss of life.

▲ CAUTION ▲

Draws the attention to methods and practices to be observed to avoid damage to equipment.

NOTE •

Draws the attention to methods for the ease of work.

REMARK:

Indicates a particular procedure to be used or gives an additional comment concerning the procedure being developed.

1.1 - General

This POH contains 9 sections and includes the material required by FAR Part 23 to be furnished to the pilot for operation of the TBM airplane. It also contains supplemental data supplied by the manufacturer, in accordance with GAMA standard.

Section 1 provides basic data and information of general interest. It also contains definitions or explanations of abbreviations and terminology commonly used.

Whenever this POH refers to the GARMIN integrated Flight Deck Pilot's Guide, it states the one described in section 2.1.

Whenever this POH refers to the ESI-2000 Pilot's Guide, it states the one described in section 2.1.

The general information for complex optional systems are given in section 9, Supplements of the POH.

Part 135 operations

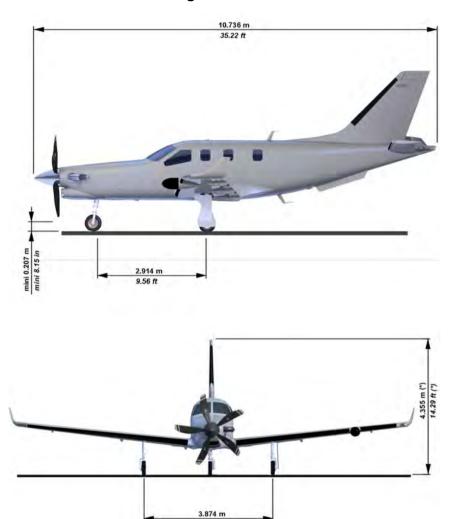

For 14 CFR 135 operations, TBM airplane alternative source of electric power is able to supply 150 percent of the electrical loads of all required instruments and equipment for safe emergency operation of the aircraft for at least 1 hour.

Electrical load shedding procedure provided in section 3 of this POH must be followed in order to meet the requirements of that paragraph under 14 CFR 135.163(f)(2).

1.3 - Descriptive data

Engine

Number of engines: 1

Engine manufacturer: PRATT & WHITNEY CANADA

Engine model number: PT6A - 66D

Engine type: Free turbine, reverse flow and 2 turbine sections

Compressor type: 4 axial stages, 1 centrifugal stage

Combustion chamber type: annular

Turbine type: 1 gas generator turbine stage, 2 power turbines stages

Horsepower rating and propeller speed: 850 SHP at 2000 RPM

Propeller

Number of propellers: 1

Propeller manufacturer: HARTZELL

Propeller model number: HC-E5N-3C/NC8834K

Number of blades : 5

Propeller diameter :

Minimum: 90 in (2.286 m) Maximum: 91 in (2.311 m)

Propeller type: Adjustable constant speed, with feathering and hydraulic control

reverse

Propeller blade setting at station 30 in:

Low pitch : 19.5° Feathering : 85°

Maximum reverse: - 9°

Propeller governor: 8210.007 WOODWARD

Fuel

Total capacity: 301 USG (1140 litres)

Total capacity each tank: 150.5 USG (570 litres)

Total usable: 292 USG (1106 litres)

▲ CAUTION ▲

The fuel used must contain an anti-ice additive, in accordance with specification MIL-I-27686 or MIL-I-85470. Additive concentrations (EGME or DIEGME) shall be comprised between a minimum of 0.06 % and a maximum of 0.15 % by volume. Refer to section 8 Handling, servicing and maintenance for additional information.

▲ CAUTION ▲

The use of aviation gasoline (AVGAS) must be restricted to emergency purposes only. AVGAS shall not be used for more than 150 cumulative hours during any period between engine overhaul periods.

• NOTE •

Use of AVGAS to be recorded in engine module logbook.

•

Engine oil

System total capacity: 12.7 Quarts (12 litres) (oil cooler included)

Usable capacity: 6 Quarts (5.7 litres)

Maximum oil consumption in 10 hour period : 0.14 qt/hr (0.13 l/hr)

[0.3 lb/hr (0.136 cc/hr)]

Specification

Nominal viscosity	Specification	NATO code		
5cSt	MII -PRF-23699G	O-156 (STD)		
	WIL-PRF-23099G	O-154 (HTS)		

Figure 1.3.2 - Recommended engine oil types

Reference : Service Bulletin P & W C. No. 14001 at the latest revision

Maximum certificated weights

Ramp: 7430 lbs (3370 kg)

Takeoff: 7394 lbs (3354 kg) Landing: 7024 lbs (3186 kg)

Baggage weight

- refer to section 2, paragraph 2.5 for weight and C.G. limits

- refer to section 6 for cargo loading instructions

Standard airplane weights

Standard empty weight: 4583 lbs (2079 kg)

Maximum useful load: 2811 lbs (1275 kg)

Cabin and entry dimensions

Maximum cabin width: 3 ft 11.64 in (1.21 m)

Maximum cabin length: 13 ft 3.45 in (4.05 m)

Maximum cabin height: 4 ft (1.22 m)

Number of cabin entries: 1 (standard) + 1 pilot door (if installed)

Entry width (standard): 3 ft 6.52 in (1.08 m)

Entry height (standard): 3 ft 10.85 in (1.19 m)

Pilot entry mean width: 2 ft 3.6 in (0.70 m)

Pilot entry mean height: 3 ft 2.16 in (0.97 m)

Specific loadings

Wing loading: $38.16 \text{ lbs / sq.ft} (186.3 \text{ kg / m}^2)$ Power loading: 8.7 lbs / SHP (3.95 kg / SHP)

1.4 - Abbreviations and terminology

Meteorological terminology

ISA : International standard atmosphere

OAT : Outside air temperature
SAT : Static air temperature

QFE : Atmospheric pressure at the airport reference point.

QNH : Atmospheric pressure at sea level, at airplane position.

NOTE •

On the ground, the altimeter will indicate zero if it is set to QFE. It will indicate airport altitude if it is set to QNH.

Standard Temperature :

Is 15°C (59°F) at sea level pressure altitude and decreases by 2°C (3.6°F) for each 1000 ft of altitude.

Pressure altitude:

Is the altitude read from an altimeter when the altimeter's barometric scale has been set to 29.92 inches of mercury (1013.2 hPa).

General airspeed terminology and symbols

KCAS: Knots Calibrated Airspeed is the indicated airspeed expressed in

knots corrected for position and instrument error. Knots calibrated airspeed is equal to KTAS in standard atmosphere at sea level.

KIAS : Knots Indicated Airspeed is the speed shown on the airspeed

indicator and expressed in knots.

KTAS : Knots True Airspeed is the airspeed expressed in knots relative to

undisturbed air which is KCAS corrected for altitude and

temperature.

V_Δ : Maneuvering Speed is the maximum speed at which full or abrupt

control movements may be used.

V_{FE} : Maximum Flap Extended Speed is the highest speed permissible

with wing flaps in a prescribed extended position.

V_{LE}: Maximum Landing Gear Extended Speed is the maximum speed at

which an airplane can be safely flown with the landing gear

extended.

 V_{S1}

Pilot's Operating Handbook

 ${
m V_{LO}}$: Maximum Landing Gear Operating Speed is the maximum speed at

which the landing gear can be safely extended or retracted.

V_{MO} : Maximum Operating Speed is the speed limit that may not be

deliberately exceeded in normal flight operations.

V_R : Rotation Speed is the speed at which rotation is initiated during

takeoff to achieve takeoff safety speed at screen height.

V_{SO} : Stalling Speed or the minimum steady flight speed at which the

airplane is controllable in the landing configuration.

Stalling Speed or the minimum steady flight speed obtained in a specific configuration.

 V_x : Best Angle of Climb Speed is the airspeed which delivers the

greatest gain of altitude in the shortest possible horizontal distance.

V_Y: Best Rate of Climb Speed is the airspeed which delivers the

greatest gain in altitude in the shortest possible time.

Power terminology

Recovery altitude:

Maximum altitude at which it is possible, in standard temperature, to maintain a specified power.

Overheated start:

Engine start or attempt to start which causes the interturbine temperature to be higher than the maximum value permissible during start.

Flame out: Involuntary loss of the combustion chamber flame during operation.

GPU: Ground power unit.

Feathering: Action which reduces the drag of a propeller by positioning blades at

the pitch angle allowing minimal drag.

Maximum Cruise Power:

Power developed corresponding to outside flight level and

temperature conditions - refer to chapter 5 Performance.

Ng : Gas generator RPM.

Np : Propeller rotation speed.

Reverse: Drag produced when the propeller blade setting is negative.

RPM: Revolutions per minute.

SHP: Shaft Horsepower.

TRQ : Torque.

Airplane performance and flight planning terminology

Climb gradient :

Is the ratio of the change in height during a portion of climb, to the horizontal distance traversed in the same time interval.

Demonstrated crosswind velocity:

Is the velocity of the crosswind component for which adequate control of the airplane during takeoff and landing was actually demonstrated during certification tests. The value shown is not considered to be limiting.

g : Is acceleration due to gravity.

Usable fuel: Total fuel which can be effectively consumed by the engine.

Weight and balance terminology

Reference datum:

Datum perpendicular to the longitudinal airplane centerline from which all distances are measured for balance purpose.

Arm : Is the distance from the reference datum to the center of gravity

(C.G.) of an item.

Moment: Is the product of the weight of an item multiplied by its arm.

Center of gravity (C.G.):

Airplane balance point. Its distance from the reference datum is found by dividing the total moment by the total weight of the airplane.

C.G. limits : Center of Gravity Limits are the extreme center of gravity locations

within which the airplane must be operated at a given weight.

Standard empty weight:

Weight of a standard airplane including unusable fuel and full operating fluids (oil and hydraulic fluids).

Basic empty weight:

Standard empty weight plus optional equipment.

Useful load: Is the difference between maximum ramp weight and the basic

empty weight.

Maximum ramp weight:

Is the maximum weight approved for ground maneuver. It includes $% \left(x\right) =\left(x\right) +\left(x\right) +\left($

the weight of start, taxi and run up fuel.

Maximum takeoff weight :

Is the maximum weight approved at the beginning of the takeoff run.

Maximum landing weight:

Is the maximum weight approved for landing touchdown.

General abbreviations

A : Ampere or Amber

ADC : Air Data Computer

AGL : Above ground level

ALT. SEL. : Altitude selector

ALTI : Altimeter

AMP : Ampere

AP : Autopilot

AUTO SEL : Automatic selector

AUX BP : Auxiliary boost pump

BAT : Battery

BAT OVERHEAT: Battery overheat, only with Cadmium-Nickel battery

BRT : Brightness

CAS : Crew Alerting System

°C : Celsius degree

CONT. : Control

DIEGME : Diethylene glycol monomethyl ether

DISC : Disconnect

DN : Down

ECS : Environmental control system

EDM : Emergency Descent Mode

EGME : Ethylene glycol monomethyl ether

EIS : Engine Indication System

Page 1.4.4 Edition 1 - December 5, 2014

EMER : Emergency

ENCOD. ALTI: Encoding altimeter

ESHP : Estimated shaft horsepower

ESS. BUS TIE : Essential BUS tie

EXT. LIGHTS : Exterior lightings

°F : Fahrenheit degree

FCU : Fuel control unit

2.1 - General

TBM 900 is the trade name of the TBM 700 N version airplane (TBM 700 type), which is certified in the normal category.

This airplane must be flown in compliance with the limits specified by placards or markings and with those given in this section and throughout the POH.

The GARMIN G1000 Integrated Flight Deck Pilot's Guide, No. 190-00709-05, or any later version as applicable, must be readily available to the pilot and permanently kept in the airplane with the POH.

The Pilot's Guide for the Electronic Standby Indicator Model ESI-2000 P/N 0040-32500-01 Rev. E or any later version as applicable, must be permanently kept in the airplane with the POH.

Departure into IMC is not authorized if the ESI-2000 battery symbol is present with an amber battery symbol (less than 1 hour remaining), or an amber or red X over the battery symbol or a CAL DUE message by the battery symbol.

This section of the airplane POH presents the various operating limitations, the significance of such limitations, instrument markings, color coding, and basic placards necessary for the safe operation of the airplane, its powerplant and installed equipment.

The limitations included in this section have been approved by the Federal Aviation Administration in accordance with 14 CFR section 21.29.

The limitations for some optional systems are given in section 9, Supplements of the POH.

TBM 700 airplane is certified under EASA.A.010 and FAA N° A60EU Type Certificates.

Section 2 Limitations EASA Approved

Intentionally left blank

2.2 - Airspeed limitations

Airspeed limitations and their operational significance are shown in figure 2.2.1.

	Speed	KCAS	KIAS	Remarks
V _{MO}	Maximum operating speed	271	266	Do not intentionally exceed this speed in normal flight category
V _A	Maneuvering speed	160	158	Do not make abrupt or full control movements above this speed
V _{FE}	Maximum flaps extended speed: landing configuration takeoff configuration	120 180	122 178	Do not exceed these speeds depending on flaps position
V _{LO}	Maximum landing gear operating speed : extension retraction emergency extension	180 151 151	178 150 150	Do not extend or retract landing gear above this speed
V _{LE}	Maximum landing gear extended speed	180	178	Do not exceed this speed with landing gear extended

Figure 2.2.1 - Airspeed limitations

Section 2 Limitations EASA Approved

Intentionally left blank

- Powerplant limitations 2.3

Engine

Number of engines: 1

Engine manufacturer: PRATT & WHITNEY CANADA

Engine model number: PT6A - 66D

Maximum power:

100 % at Np = 2000 RPM

Ng limitation:

104.1 %

Np limitation:

2000 RPM ± 40 RPM

ITT limitations:

Takeoff: 850°C

Maximum climb/cruise: 840°C

During start: < 850°C, no duration limitation

< 870°C for 20 seconds max.

< 1000°C for 5 seconds max.

▲ CAUTION ▲

When normally operating, refer to chapter 5.8 Engine operation tables.

Oil

▲ CAUTION ▲

Do not mix different viscosities or specifications of oil as their different chemical structure can make them incompatible.

Maximum oil temperature : 104 °C

Oil pressure:

Minimum: 60 psi

 Maximum: 135 psi, a transient oil pressure up to 170 psi is acceptable for maximum 20 seconds

Normal oil pressure is 105 to 135 psi. Oil pressures under 105 psi are undesirable. Under emergency conditions, to complete a flight, a lower oil pressure of 60 psi is permitted at reduced power level not exceeding 80% torque. Oil pressures below 60 psi are unsafe and require that either the engine be shut down or a landing be made as soon as possible using the minimum power required to sustain flight.

Oil capacity:

System total capacity: 12.7 Quarts (12 litres), oil cooler included

Usable capacity: 6 Quarts (5.7 litres)

Fuel

Fuel limitations:

2 tanks : 150.5 USG (570 litres) each

Total fuel: 301 USG (1140 litres)

Usable fuel: 292 USG (1106 litres)

- Unusable fuel: 9 USG (34 litres)

- Maximum fuel imbalance : 15 USG (57 litres)

• NOTE •

Usable fuel can be safely used during all normal airplane maneuvers.

▲ CAUTION ▲

The fuel used must contain an anti-ice additive, in accordance with specification MIL-I-27686 or MIL-I-85470. Additive concentrations (EGME or DIEGME) shall be comprised between a minimum of 0.06 % and a maximum of 0.15 % by volume. Refer to section 8 Handling, servicing and maintenance for additional information.

▲ CAUTION ▲

The use of aviation gasoline (AVGAS) must be restricted to emergency purposes only. AVGAS shall not be used for more than 150 cumulative hours during any period between engine overhaul periods.

NOTE •

Use of AVGAS to be recorded in engine module logbook.

US specification (US)	French specification (FR)	English specification (UK)	NATO code
ASTM-D1655 JET A ASTM-D1655 JET A1 ASTM-D1655 JET B	AIR 3405C Grade F35	DERD 2494 Issue 9	F35 without additive
MIL-DTL-5624 Grade JP-4	ΔIR 3407B		F40 with additive
MIL-DTL-5624 Grade JP-5	I AIR 3404C Grade F44		F44 with additive when utilization
MIL-DTL-83133 Grade JP-8	I AIR 3405C Grade F34		F34 with additive S748
	AIR 3404C Grade F43	DERD 2498 Issue 7	F43 without additive

Figure 2.3.1 - Recommended fuel types Reference : Service Bulletin P & W C. No. 14004

Propeller

Number of propellers: 1

Propeller manufacturer: HARTZELL

Propeller model number: HC-E5N-3C/NC8834K

Propeller diameter:

- Minimum : 90 in (2.286 m)

Maximum: 91 in (2.311 m)

Propeller blade setting at station 30 in :

- Low pitch : 19.5°

Feathering: 85°

Maximum reverse : - 9°

2.4 - Starter operation limits

Starter operation sequence is limited as follows :
if Ng < 30 %
if Ng > 30 % $$ 60 seconds
Should several sequences be necessary, respect following spacing :
1st sequence
wait
2nd sequence
wait 5 minutes
3rd sequence
wait
4th sequence

Section 2 Limitations EASA Approved

Intentionally left blank

2.5 - Weight and C.G. limits

Weight limits

Maximum ramp weight (MRW): 7430 lbs (3370 kg)

Maximum takeoff weight (MTOW): 7394 lbs (3354 kg)

Maximum landing weight (MLW): 7024 lbs (3186 kg)

Maximum zero fuel weight (MZFW): 6032 lbs (2736 kg)

Maximum baggage weight:

- in FWD compartment (non pressurized) : 110 lbs (50 kg)

>> With 6-seat accommodation

- in rear part of pressurized cabin: 220 lbs (100 kg)

>> With 4-seat accommodation

 in rear part of pressurized cabin: 396 lbs (180 kg), with small or large net, see sketch below

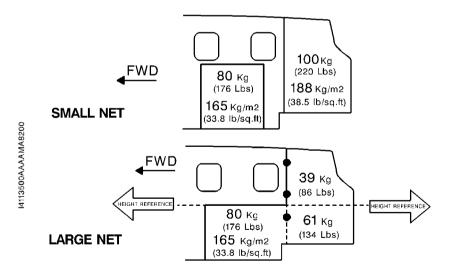

Figure 2.5.1 - Baggage limits

C.G. limits

Center of gravity range with landing gear down and flaps up, attitude 0°:

Forward limits:

181.3 in (4.604 m) aft of datum at 4409 lbs (2000 kg) or less (14 % of m.a.c)

183.6 in (4.664 m) aft of datum at 6250 lbs (2835 kg) (18 % of m.a.c)

185.3 in (4.707 m) aft of datum at 6579 lbs (2984 kg) (20.85 % of m.a.c)

187 in (4.752 m) aft of datum at all weights above 7024 lbs (3186 kg) (23.8 % of m.a.c)

Aft limits:

193.65 in (4.921 m) aft of datum at 7394 lbs (3354 kg) (35 % of m.a.c.) 194 in (4.928 m) aft of datum at 6986 lbs (3169 kg) (35.5 % of m.a.c.)

Reference datum: 118.1 in (3 m) in front of the firewall front face.

Straight line variation between points.

Leveling point: Cabin floor rails.

NOTF •

It is the responsibility of the pilot to insure that the airplane is properly loaded. See section 6 Weight and balance for proper loading instructions.

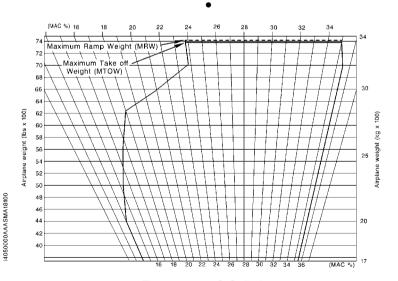

Figure 2.5.2 - C.G. limits

2.6 - Operation limits

Maneuver limits

This airplane is certified in the normal category.

The normal category is applicable to airplanes intended for non-aerobatic operations.

Non-aerobatic operations include any maneuvers incidental to normal flying, stalls (except whip stalls), lazy eights, chandelles, and steep turns in which the angle of bank is no more than 60°.

▲ WARNING ▲

Aerobatic maneuvers, including spins, are not approved.

Temperature limits

Minimum temperature at start and takeoff: - 40°C (- 40°F)

Maximum temperature at start and takeoff:

ISA + 37°C (+ 67°F) from 0 to 8000 ft pressure altitude

Maximum temperature in flight:

ISA + 37°C (+ 67°F) from 0 to 8000 ft pressure altitude

ISA + 30°C (+ 54°F) above 8000 ft pressure altitude

Flight load factor limits

Flaps up

Weight below 6579 lbs (2984 kg): - 1.5 < n < + 3.8 g

Weight above 6579 lbs (2984 kg): - 1.5 < n < + 3.5 g

Flaps down

- 0 < n < + 2.0 g

▲ CAUTION ▲

Intentional negative load factors prohibited.

Generator limits

Generator load has to be below 200 AMP when the airplane is on the ground.

GFC 700 autopilot limits

- During autopilot operation, a pilot with seat belt fastened must be seated at the left or right position.
- The autopilot and yaw damper must be OFF during takeoff and landing.
- Do not engage autopilot below 1000 ft (300 m) above ground level in cruise or climb.
- Do not use autopilot in approach under 200 ft (60 m).
- Do not use autopilot for airspeeds below 85 KIAS.

NOTE •

Do not use the autopilot in descent below 2000 ft (600 m) AGL with a vertical speed in excess of 2000 ft/mn.

•

GNSS (GPS/SBAS) navigation equipment approvals

The Garmin GNSS navigation system installed in this airplane is a GPS system with a Satellite Based Augmentation System (SBAS) comprised of two TSO-C145a Class 3 approved Garmin GIA 63Ws, TSO-C146c Class 3 approved Garmin GDU 1XXX Display Units, Garmin GA36 and GA37 antennas, and GPS software version 3.2 or later approved version. The Garmin GNSS navigation system in this airplane is installed in accordance with AC 20-138A.

The Garmin GNSS navigation system as installed in this airplane complies with the requirements of AC 20-138A and AMC 20-28, is approved for navigation using GPS and SBAS (within the coverage of a Satellite Based Augmentation System complying with ICAO Annex 10) for IFR enroute, terminal area, and non-precision approach operations (including those approaches titled GPS, or GPS and RNAV (GPS) approaches). The Garmin GNSS navigation system installed in this airplane is approved for approach procedures with vertical guidance including LPV (within the coverage of a Satellite Based Augmentation System complying with ICAO Annex 10) and LNAV/VNAV, within the U.S. National Airspace System.

The airplane is approved for enroute and terminal operations including RNAV5 / BRNAV and RNAV1 / PRNAV in accordance with JAA TGL--10, provided the FMS is receiving usable navigation information from one or more GPS receivers.

GNSS (GPS/SBAS) navigation system limitations

NOTE •

Limitations are in bolded text for this section only.

•

The pilot must confirm at system initialization that the navigation database is current.

Navigation database is expected to be current for the duration of the flight.

If the AIRAC cycle will change during flight, the pilot must ensure the accuracy of navigation data, including suitability of navigation facilities used to define the routes and procedures for flight. If an amended chart affecting navigation data is published for the procedure, the database must not be used to conduct the procedure.

GPS/SBAS based IFR enroute, oceanic, and terminal navigation is prohibited unless the pilot verifies and uses a valid, compatible, and current navigation database or verifies each waypoint for accuracy by reference to current approved data.

Discrepancies that invalidate a procedure must be reported to Garmin International. The affected procedure is prohibited from being flown using data from the navigation database until a new navigation database is installed in the airplane and verified that the discrepancy has been corrected.

Contact information to report navigation database discrepancies can be found at www.Garmin.com>Support>Contact Garmin Support>Aviation. Pilots and operators can view navigation data base alerts at www.Garmin.com > In the Air> NavData Alerts.

For flight planning purposes, in areas where SBAS coverage is not available, the pilot must check RAIM availability.

Within the United States, RAIM availability can be determined using the WFDE Prediction program, part number 006-A0154-01 (010-G1000-00) or later approved version with GARMIN GA36 and GA37 antennas selected, or the FAA's enroute and terminal RAIM prediction website: www.raimprediction.net, or by contacting a Flight Service Station.

Within Europe, RAIM availability can be determined using the WFDE Prediction program or Europe's AUGUR GPS RAIM Prediction Tool at http://augur.ecacnav.com/augur/app/home.

For other areas, use the WFDE Prediction program.

This requirement is not necessary if SBAS coverage is confirmed to be available along the entire route of flight.

The route planning and WFDE prediction program may be downloaded from the GARMIN website on the internet. For information on using the WFDE Prediction Program, refer to GARMIN WAAS FDE Prediction Program, part number 190-00643-01, WFDE Prediction Program Instructions.

For flight planning purposes, operations within the U.S. National Airspace System on RNP and RNAV procedures when SBAS signals are not available, the availability of GPS integrity RAIM shall be confirmed for the intended route of flight.

In the event of a predicted continuous loss of RAIM of more than five minutes for any part of the intended route of flight, the flight should be delayed, cancelled, or re-routed on a track where RAIM requirements can be met.

For flight planning purposes for operations within European B-RNAV and P-RNAV airspace, if more than one satellite is scheduled to be out of service, then the availability of GPS integrity RAIM shall be confirmed for the intended flight (route and time).

In the event of a predicted continuous loss of RAIM of more than five minutes for any part of the intended flight, the flight should be delayed, cancelled, or re-routed on a track where RAIM requirements can be met.

For flight planning purposes, operations where the route requires Class II navigation the airplane's operator or pilot-in-command must use the WFDE Prediction program to demonstrate that there are no outages on the specified route that would prevent the G1000 to provide primary means of Class II navigation in oceanic and remote areas of operation that requires (RNP-10 or RNP-4) capability.

If the WFDE Prediction program indicates fault exclusion (FDE) availability will exceed 34 minutes in accordance with FAA Order 8400.12A for RNP-10 requirements, or 25 minutes in accordance with FAA Order 8400.33 for RNP-4 requirements, then the operation must be rescheduled when FDE is available.

Both GPS navigation receivers must be operating and providing GPS navigation guidance to their respective PFD for operations requiring RNP-4 performance.

North Atlantic (NAT) Minimum Navigational Performance Specifications (MNPS) Airspace operations per AC 91-49 and AC 120-33 require both GPS/SBAS receivers to be operating and receiving usable signals except for routes requiring only one Long Range Navigation sensor. Each display computes an independent navigation solution based on the on-side GPS sensor. However, either display will automatically revert to the cross-side sensor if the on-side sensor fails or if the cross-side sensor is determined to be more accurate. A BOTH ON GPS1 or BOTH ON GPS2 message does not necessarily mean that one GPS has failed. Refer to the MFD AUX-GPS STATUS page to determine the state of the unused GPS.

Manual entry of waypoints using latitude/longitude or place/bearing is prohibited.

Whenever possible, RNP and RNAV routes including Standard Instrument Departures (SIDs) and Obstacle Departure Procedures (ODPs), Standard Terminal Arrival (STAR), and enroute RNAV Q and RNAV T routes should be loaded into the flight plan from the database in their entirety, rather than loading route waypoints from the database into the flight plan individually. Selecting and inserting individual named fixes from the database is permitted, provided all fixes along the published route to be flown are inserted.

GPS, or GPS and RNAV (GPS) instrument approaches using the G1000 System are prohibited unless the pilot verifies and uses the current navigation database. GPS based instrument approaches must be flown in accordance with an approved instrument approach procedure that is loaded from the navigation database.

LNAV+V feature is a standard LNAV approach with advisory vertical guidance provided for assistance in maintaining a constant vertical glidepath similar to an ILS glideslope on approach. This guidance is displayed on the G1000 PFD in the same location as the ILS glideslope using a magenta diamond. In all cases where LNAV+V is indicated by the system during an approach, LNAV minima are used.

Not all published Instrument Approach Procedures (IAP) are in the navigation database.

Pilots planning on flying an RNAV instrument approach must ensure that the navigation database contains the planned RNAV Instrument Approach Procedure and that approach procedure must be loaded from the navigation database into the FMS flight plan by its name.

IFR non-precision approach approval using the GPS/SBAS sensor is limited to published approaches within the U.S. National Airspace System. Approaches to airports in other airspace are not approved unless authorized by the appropriate governing authority.

The navigation equipment required to join and fly an instrument approach procedure is indicated by the title of the procedure and notes on the IAP chart.

Use of the GARMIN G1000 GPS/SBAS receivers to provide navigation guidance during the final approach segment of an ILS, LOC, LOC-BC, LDA, SDF, MLS or any other type of approach not approved for or GPS navigation is prohibited. When using the G1000 VOR/LOC/GS receivers to fly the final approach segment, VOR/LOC/GS navigation data must be selected and presented on the CDI of the pilot flying.

Navigation information is referenced to WGS-84 reference system, and should only be used where the Aeronautical Information Publication (including electronic data and aeronautical charts) conform to WGS-84 or equivalent.

SID/STAR

The use of SIDs and STARs stored in GPS database is only authorized if the pilot has checked that GPS procedure corresponds to the one given in the official documentation (coordinates of various points and paths between points).

Instrument approach (Non precision approach)

Use of the GPS to perform an instrument approach is possible as long as this use is approved by the air navigation local authority for the approach in question.

Instrument approaches performed with the GPS must be executed according to approved approach procedures given in the GPS database. The database must be kept up to date and base data accuracy checked with regard to the official documentation, preferably before the flight.

- GPS/RNAV instrument approaches must be performed in GPS approach mode and the RAIM must be available at the final approach fix (FAF).
- Precision approaches (ILS, LOC, LOC-BC, MLS ...) must not be performed with the GPS.

Instrument approaches can only be performed as long as used point coordinates are referenced with regard to WGS 84 system or an equivalent system.

Icing conditions

In any case of icing conditions, first refer to Particular procedures described in chapter 4.5 and in case of unforeseen icing conditions, refer in addition to the Emergency procedure described in chapter 3.12.

Severe icing conditions

▲ WARNING ▲

Severe icing may result from environmental conditions outside of those for which the airplane is certificated. Flight in freezing rain, freezing drizzle, or mixed icing conditions (supercooled liquid water and ice crystals) may result in ice build-up on protected surfaces exceeding the capability of the ice protection system, or may result in ice forming aft of the protected surfaces. This ice may not be shed using the ice protection systems, and may seriously degrade the performance and controllability of the airplane.

During flight, severe icing conditions that exceed those for which the airplane is certificated shall be determined by the following visual cues. If one or more of these visual cues exists, immediately request priority handling from air traffic control to facilitate a route or an altitude change to exit the icing conditions.

- Unusually extensive ice accumulation on the airframe and windshield in areas not normally observed to collect ice.
- Accumulation of ice on the upper surface of the wing aft of the protected area.

Since the autopilot, when operating, may mask tactile cues that indicate adverse changes in handling characteristics, use of the autopilot is prohibited when any of the visual cues specified above exist, or when unusual lateral trim requirements or autopilot trim warnings are encountered while the airplane is in icing conditions.

Refer to the list of equipment required depending on type of operation in this same chapter.

Refer to Particular procedures described in chapter 4.5 and in case of unforeseen icing conditions, refer in addition to the Emergency procedure described in chapter 3.12.

Flap operating envelope

The use of flaps is not authorized above 15 000 ft.

Reverse utilization

The use of control reverse BETA (β) range is prohibited:

- during flight,
- on ground, if the engine is not running.

Weather radar GWX 70

On ground, the radar radiation is inhibited when the landing gear shock absorbers are compressed. However, it is important to obey the following restrictions :

- Do not operate the radar during refueling operations or in the vicinity of trucks or containers containing flammables or explosives.
- Do not allow personnel within 12 feet of area being scanned by antenna when system is transmitting.

Equipment required depending on type of operation

The airplane is approved for day & night VFR and day & night IFR operations when appropriate equipment is installed and operating correctly.

The type certification for each use requires the following equipment. The equipment must be installed and operate perfectly according to the indicated type of use.

▲ CAUTION ▲

It is the pilot's responsibility to check that the following equipment lists are in accordance with the specific national operation rules of the airplane registration country depending on the type of operation.

Systems and equipment mentioned hereafter do not include specific flight and radio-navigation instruments required by decree concerning operation conditions for civil airplanes in general aviation or other foreign regulations (for example FAR PART 91 and 135).

Day VFR

- Pilot instruments
 - Airspeed indicator
 - Sensitive and adjustable altimeter
 - Magnetic compass with built-in compensator

2. CAS warning and caution messages

- Oil pressure
- Low fuel pressure
- Fuel selector OFF
- Fuel auxiliary pump ON
- L.H. and R.H fuel tank low level
- Non functioning of fuel timer
- Battery stop
- Main generator OFF
- Low voltage
- Ground power unit connected
- Inertial separator
- Starter
- Ignition
- Flaps
- Landing gears and doors

3. Aural warning

- V_{MO} warning
- Landing gear warning
- Stall warning

4. Engine instruments

- Torquemeter
- Propeller tachometer
- Interturbine temperature indicator (ITT)
- Gas generator tachometer (Ng)
- Oil pressure indicator
- Oil temperature indicator

5 Various indicators

- Fuel gauge indicators (2)
- Voltmeter
- Ammeter
- Outside air temperature

6. Installations

- Fuel mechanical pump (main)
- Fuel electrical pump (auxiliary)
- Fuel shut-off valve
- Fuel timer
- Starter generator
- Inertial separator
- Stall warning
- Electrical aileron trim
- Electrical rudder trim
- Manual elevator pitch trim
- Engine ignition
- Landing gear electro-hydraulic unit
- Landing gear emergency hydraulic pump (manual)
- **Flaps**
- Overspeed regulator
- Electrical feathering
- Batterv

7. Miscellaneous

- Seats (each occupant)
- Belts (each occupant)
- Straps (each occupant)
- Pilot's operating handbook

Night VFR

- 1. All equipment required for day VFR
- 2. Attitude display indicator
- 3. Instrument lighting
- 4. Instrument panel lighting
- 5. Emergency lighting
- 6. Vertical speed indicator
- 7. Navigation lights (4)
- 8. Anticollision lights (2)
- 9. Landing light

IFR

- 1. All equipment required for day VFR
- 2. All equipment required for night VFR, if flight is performed during night
- 3. Taxi light, if flight is performed during night
- 4. Clock
- 5. 2nd altimeter
- 6. Emergency static source
- 7. Pitot static tube deicing

Pressurized flight

- 1. Cabin altimeter
- 2. Cabin vertical speed indication
- 3. Cabin differential pressure indication
- 4. Pressurization control valve
- 5. Safety valve
- 6. Pressurization control
- 7. Maximum cabin altitude and pressure warning light

Flight into icing conditions

- 1. All equipment required for IFR flight
- 2. Propeller deicing
- 3. L.H. windshield deicing
- 4. Airframe, stabilizer and elevator horn deicing
- 5. Wing leading edge inspection light, if night flight
- 6. Stall warning deicing
- 7. Inertial separator
- 8. Garmin annunciation "Airspeed"

Altitude operating limits

Maximum altitude: 31000 ft (9449 m)

Maximum differential pressure: 6.2 psi

Operation in RVSM area

This airplane is approved for operations in Reduced Vertical Separation Minimum (RVSM) airspace when required equipment is maintained in accordance with the airplane maintenance manual - refer to section List of equipment, paragraph List of critical RVSM equipment.

This does not constitute operational approval. Individual airplane and operational approval must be obtained in accordance with applicable operating rules.

Each operator must ensure compliance with required crew training and operating practices and procedures.

Moreover, the following equipment must be installed and operating normally upon entering RVSM airspace :

- Pilot and R.H. station primary altimeters
- Autopilot
- Altitude alerter
- ATC transponder

NOTE •

Any changes to the pitot / static, air data computer, autopilot, altitude alerting and / or transponder systems, or other changes that affect operation of these systems must be evaluated for impact on the RVSM approval.

The standby altimeter is not approved for RVSM operations.

In-flight breaker use limits

A tripped breaker should not be reset in flight unless deemed necessary for continued safe flight and landing. Only one reset should be attempted.

Enhanced mode S

The installed mode S system satisfies the data requirements of ICAO Doc 7030/4, regional supplementary procedures for SSR mode S enhanced surveillance in designated european airspace. The capability to transmit data parameters is shown in column 2:

Parameter	Available (A) / Not available (NA)		
Magnetic heading	A		
Indicated airspeed	A		
Mach No	A		
Vertical rate	A		
Roll angle	A		
True airspeed	A		
True track angle	A		
Groundspeed	A		
Selected altitude	А		
Barometric pressure setting	A		

Chartview system operating limitations

The geographic-referenced airplane symbol on some charts must not be used for navigation.

• NOTE •

The airplane symbol displayed on some charts provides supplemental airplane situational awareness information. It is not intended as a means for navigation or flight guidance. The airplane symbol is not to be used for conducting instrument approaches or departures, and it should not be relied upon during low visibility taxi operations. Position accuracy, orientation, and related guidance must be assured by other means of required navigation.

•

Operators must have back-up charts available to the flight crew.

Database currency must be verified prior to use via database effectivity page.

The flight crew is responsible for verifying availability of charts for the planned flight.

Section 2 Limitations EASA Approved

Intentionally left blank

2.7 - Miscellaneous limits

Seating limits C.G.

- 2 front seats at 178.5 in (4.534 m)
- >> With 4-seat accommodation or 6-seat accommodation
- 2 intermediate seats at 224.8 in (5.710 m)
- >> With 6-seat accommodation
- Rear bench (2 seats) at 267.1 in (6.785 m)

Baggage limits

- Baggage in pressurized cabin at 303 in (7.695 m)
- Baggage in non pressurized forward section at 128 in (3.250 m)

Minimum crew

One pilot

Maximum occupancy

The number of persons on board is limited by approved seating configuration installed but must not exceed six, including the pilot.

The number of persons must be less than or equal to the number of seats.

Use of doors

Flight with door open or ajar is prohibited.

Chemical toilet cabinet, if installed

The cabinet must be stowed during takeoff and landing. No baggage on the top of the cabinet for the whole flight.

Cargo net installation limits

Small cargo net: maximum loading height = 28 in (710 mm)

Large cargo net: maximum loading height = 22 in (565 mm) in cabin, out of baggage compartment.

▲ CAUTION ▲

No item may extend forward of the cargo net system to protect door from obstruction.

2.8 - Markings

Airspeed indicator on PFD(s)

Markings and their color code significance are shown in figure 2.8.1.

Marking	KIAS (Value or range)	Significance
Red strip	Below 65	1
White strip	65 - 122	Full flap operating range Lower limit is maximum weight V _{SO} in landing configuration.
Green strip	122 - 266	Normal operating airspeed range
Red/white barber pole strip	Above 266	266 = VMO

Figure 2.8.1 - Airspeed indicator markings

Standby airspeed indicator

Markings and their color code significance are shown in figure 2.8.2.

Marking	KIAS (Value or range)	Significance
Red strip	Below 65	1
White strip	65 - 122	Full flap operating range Lower limit is maximum weight V _{SO} in landing configuration.
Green strip	122 - 266	Normal operating airspeed range
Red strip	266	Maximum speed for all operations

Figure 2.8.2 - Standby airspeed indicator markings

Pressurization

Marking	Value	Significance
Red line	6.2 psi	Cabin ΔP limit

Figure 2.8.3 - Pressurization marking

Engine instruments

Engine instrument markings and their color code significance are shown in figure 2.8.4.

Indication	Red line or arc Minimum limit	Yellow line or arcCaution range	Green line or arc Normal operating	Red line Maximum limit	
Oil temperature			0 to 104 °C (32 to 219.2 °F)	110 °C (230 °F)	
Oil pressure	60 psi	60 to 105 psi	105 to 135 psi	135 psi (red line) normal limit 170 psi transient limit (< 20 seconds)

3.1 - General

The recommended procedures for different failures or emergency situations are provided in this section.

Emergency procedures associated with optional or particular equipment which require pilot's operating handbook supplements are provided in section 9 Supplements.

The pilot must know procedures given in this section and be prepared to take appropriate action should an emergency arise.

Some emergency procedures are a part of pilot basic training. Although these emergencies are discussed here, this information is not intended to replace such training, but only to provide a source of reference and review. This information also provides failure procedures which are not the same for all airplanes.

It is important for the pilot to be familiar with standard emergency procedures to be at the optimum efficacy if necessary.

Alarm system recall

Main failure or state modification of the different systems are provided by warning or caution messages appearing on CAS display.

The CAS messages include:

- the **red** warning messages indicating failures which require an immediate action from the pilot, and
- the **amber** caution messages indicating failures or discrepancies which require an action as soon as practical.

Red or amber failure warnings are coupled with the lighting of

a flashing red indicator/button

or

a fixed amber indicator/button

Both indicators/buttons are located on the upper part of the L.H. instrument panel. When either one lights up, press it once to reactivate. It will go out and is ready to signal in the event of another failure. On the CAS display, the corresponding failure message remains ON as long as the failed condition exists.

The actions associated to the **red** warning or **amber** caution messages are described in this Section of the POH.

Procedure format

PROCEDURE TITLES

Name of the procedure

1/X

Procedure introduction or description of symptoms associated with the failure are presented like this at the beginning of the procedure.

1/X is written if the procedure extends over 2 pages or more.

MEMORY ITEMS

The memory items are indicated with a grey border box as shown hereafter:

The memory items are written like this.

Memory items are critical steps that must be executed quickly from memory without referring to POH or checklist.

CONDITIONAL STEPS

Conditions are presented like this:

With related actions to perform indented inside.

VALIDITY / EFFECTIVITY

>> Pre/Post-MOD70-xxxx-xx

Before procedure title, represents a specific validity / effectivity for the entire procedure below. If nothing is specified, the procedure applies to all airplanes.

- >> Validity inside a procedure is presented like this
 - 1 -With actions related to this validity listed under.

CONTINUATION AND ENDING

The end of the entire procedure is indicated by:

End of procedure.

Procedure completion within the body of the procedure as a result of a condition is indicated by:

Continuation of a procedure on several pages is indicated by:

▶ Continuing

Continue >

LANDING DIRECTIVES

- ► Land as soon as possible means land on the nearest suitable runway.
- ▶ Land as soon as practical ◀ means land on the nearest suitable runway with convenient facilities.

CAS MESSAGES

Indicated as displayed in the MFD CAS window:

- means FUEL PRESS warning CAS message,
- MAIN GEN means MAIN GEN caution CAS message.

ANNUNCIATIONS ON PFDs or MFD

Indicated as displayed in the PFD or MFD with specifying "annunciation" next to the message:

- **BOTH ON AHRS1** annunciation,
- **HDG NO COMP** annunciation.

3.2 - Rejected takeoff

Engine failure at takeoff before rotation

1 -	THR	OTTLEFlig	jht IDLE
2 -	Brak	es Ası	equired
If the a	airplar	ne cannot be stopped on the runway :	
	3 -	THROTTLE	CUT OFF
	4 -	FUEL TANK SELECTOR	OFF
	5 -	Crash lever	ull down
If nece	essary	<i>t</i> :	
	c	Evacuate after the airplane has some to a stan	

6 - Evacuate after the airplane has come to a stop.

Rejected takeoff for any other reason

1 -	THROTTLE	. Flight IDLE
2 -	Reverse	As required
3 -	Brakes	As required

If the airplane cannot be stopped on the runway:

4 -	THROTTLE CUT OFF
5 -	FUEL TANK SELECTOR OFF
6 -	Crash lever Pull down

If necessary:

7 -Evacuate after the airplane has come to a stop.

3.3 - Engine failures

Engine failure before rotation	
Perform procedure Engine failure at takeoff before Refer to	ore rotation chapter 3.2
End of	procedure.
Engine failure after rotation	1/2
► Fly the airplane ◀	
1 - MAN OVRD control Fe	ull forward
If successful:	
Fly the airplane using the MAN OVRD control for power.	
2 - THROTTLE	Flight IDLE
► Land as soon as possible ◀	
End of p	orocedure =
If unsuccessful:	
3 - MAN OVRD control Full	backward
If height does not allow to choose a suitable landing surface :	
► Land straight ahead ◀	
Without changing LANDING GEA	AR position
4 - FLAPS lever	
5 - THROTTLE	CUT OFF
	Continue ►

			Engine failure	e after rotation	2/2
► Continuin	g				
	6 -	FUEI	L TANK SELECT	OR	OFF
	Befor	re touc	ch down :		
		7 -	FLAPS lever		LDG
		8 -	Crash lever		. Pull down
				End of	procedure
If heig	ıht allo	ows to	reach a suitable l	anding surface :	
	9 -	LAN	DING GEAR leve	r	DN
	10 -	FLA	PS lever		As required
	Ма	intain	airspeeds		
		F	laps UP	105 < KIAS < 266	
	Г	F	laps TO	100 < KIAS < 178	
		Fla	aps LDG	85 < KIAS < 122	
	11 -	THR	OTTLE		. CUT OFF
	12 -	FUEI	TANK SELECT	OR	OFF
	13 -	Cras	h lever		. Pull down
				End o	of procedure.

Engine failure in flight

► Fly the airplane ◀

1 -	Autopilot Disconnect
2 -	FUEL TANK SELECTOR Switch tanks
3 -	AUX BP switch Check / Correct

If successful:

► Land as soon as possible ◀

End of procedure ■

If unsuccessful:

5 -	THROTTLE	CUT OFF
6 -	Oxygen masks	Use

OIL PRESS	or	OIL	PR	ESS
------------------	----	-----	----	------------

► Fly the airplane ◀

► Land as soon as possible ◀ 1 -Oil pressure Monitor TRQ Minimum necessary 2 -

▲ CAUTION ▲

Due to the oil pressure drop, the propeller blade angle may go towards high pitch and therefore lead to a Np propeller rotation speed decrease.

If engine power decreases:

- 3 -THROTTLE CUT OFF
- Perform procedure Forced landing 4 -Refer to chapter 3.7

Engine regulation discrepancy, power loss, throttle control loss

1/2

If circumstances and obtained minimum power allow:

(`Δ	UT	'n	N	
<u> </u>	ᄼ	u ı	ıv	IV	

In manual override mode, engine is neither protected against slam accelerations, nor against maximum speed overshooting. Avoid rapid control movements and manage engine parameters.

1 -	THROTTLE	Flight IDLE
2 -	Confirm engine still runn	ing.
3 -	FUEL TANK SELECTOR	R Switch tanks
4 -	Check that no paramete	exceeds allowed values.
5 -	MAN OVRD control	
6 -	Continue the flight.	
	► Land as s	soon as possible ◀
If the	e available power is weak :	
	7 - LANDING GEAR I	everDN Only on a glide path in final approach
	8 - FLAPS lever	LDG Only in short fina
	e cases, when MAN OVR t be sufficient to ensure a	AUTION ARD control is used, the available power a go-around in landing configuration, in is near the maximum weight.
	▶ Do not perform a go a	ound ◀
		Continue ►

Engine regulation discrepancy, power loss, throttle control loss 2/2

► Continuing			
9 -	Land normally.		
► Do	o not use the reverse ◀		
10 -	Brakes As required		
	End of procedure ■		
If minimum	power obtained is excessive :		
11 -	Reduce airspeed by setting airplane in nose-up attitude at IAS < 178 KIAS		
12 -	INERT SEP switch ON		
If IT7	> 840°C :		
	13 - INERT SEP switch OFF		
14 -	LANDING GEAR lever		
15 -	FLAPS lever TO		
16 -	Establish a long final or an ILS approach At IAS < 178 KIAS		
Whe	n runway is assured :		
	17 - FUEL TANK SELECTOR OFF		
18 -	THROTTLE FEATHER If available and necessary to extend trajectory		
19 -	FLAPS lever LDG as required At IAS < 122 KIAS		
20 -	Land normally.		
► Do	o not use the reverse ◀		
21 -	Brakes As required		
	End of procedure.		

Governor control not operating

1 - Continue the flight.

If Np < 1960 RPM:

- ▶ Do not perform a go around ◀
- ▶ Do not use the reverse ◀

In that case, the go-around performance and the reverse efficiency might be lower than expected.

The airplane repair is mandatory before any other flight.

End of procedure.

Excessive propeller rotation speed

- Reduce the power and the airplane speed to avoid propeller rotation speeds higher than 2000 RPM.
 - ► Land as soon as possible ◀
- ▶ Do not perform a go around ◀

In that case, the go-around may damage the gear reduction box and the reverse efficiency might be lower than expected.

The airplane repair is mandatory before any other flight.

Engine does not stop on ground

If the engine does not stop when the THROTTLE is set to CUT OFF:

1 -	FUEL TANK SELECTOR OFF
2 -	Wait for engine stop due to lack of fuel in the pipes.
3 -	GENERATOR selector OFF
4 -	SOURCE selector OFF
5 -	Crash lever Pull down
Inforr	n maintenance department.

During engine start:

- 2 Cancel the flight.

Inform maintenance department.

End of procedure ■

After engine start:

On ground:

3 - Cancel the flight.

Inform maintenance department.

End of procedure ■

In flight:

Inform maintenance department.

Indicates an oil chip detection.

In flight:

► Fly the airplane ◀

► Land as soon as practical ◀

Inform maintenance department.

End of procedure ■

On ground:

Do not take off Airplane is grounded

Inform maintenance department.

End of procedure.

NG HI

Indicates that Ng speed is more than 103 %.

1 -TRQ Reduce

To get Ng below 103 %

OIL TEMP
With or without OIL PRESS :
Indicates that oil temperature is below 0°C or above 104°C
1 - Oil temperature indicator
If the indicated temperature is in the green sector:
► Land as soon as possible ◀
► Fly the airplane ◀
2 - Oil temperature Monitor
End of procedure ■
If the indicated temperature is not in the green sector:
Failure is confirmed, you can expect an oil pressure failure shortly.
▲ CAUTION ▲ Due to the oil pressure drop, the propeller blade angle may go towards high pitch and therefore lead to a Np propeller rotation speed decrease.
▲ CAUTION ▲
Prepare for an engine stop shortly.
3 - TRQ Minimum necessary
► Land as soon as possible ◀
If engine power decreases:
4 - THROTTLE CUT OFF
5 - Perform procedure Forced landing

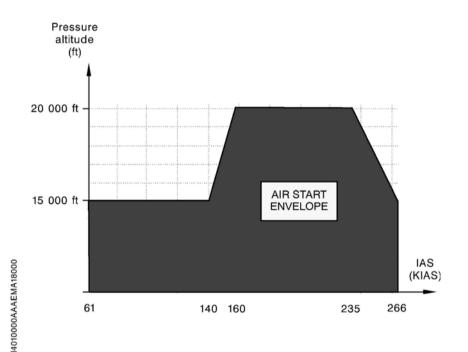

Section 3 Emergency procedures EASA Approved

► Continuing

When Ng > 50 %:

▲ CAUTION ▲

If the starter does not go off automatically, do it using the ABORT position of the starter switch.

	A STATE OF THE STA		
13 -	Starter Check OFF automatically		
14 -	THROTTLE Flight IDLE		
15 -	THROTTLE As required		
16 -	Electrical equipment As required		
17 -	AUX BP switch		
18 -	BLEED switch As required		
If necessary	y:		
19 -	Perform procedure Emergency descent Refer to chapter 3.6		
If air start is not successful:			
20 -	Perform procedure Forced landing Refer to chapter 3.7		
	End of procedure.		

Section 3 Emergency procedures EASA Approved

Intentionally left blank

3.5 - Fire and smoke

Engine fire on ground

Symptoms: ITT increasing, ITT, smoke, ...

1 -	THROTTLE CUT OFF
2 -	BLEED switch OFF / RST
3 -	A/C switch OFF
4 -	Brakes
5 -	FUEL TANK SELECTOR OFF
If ned	essary:
	6 - Warn ground assistance.
7 -	Crash lever Pull down
	▶ Evacuate as soon as possible ◀
	End of procedure.

Cabin fire on ground

1 -	THROTTLE CUT C)FF
2 -	Brakes	uired
If ned	essary :	
	3 - Warn ground assistance.	
4 -	Crash lever Pull d	lown
5 -	Cabin extinguisher As requ	uired
	▶ Evacuate as soon as possible ◀	
	End of proced	dure.

Engine fire in flight

Symptoms: ITT increasing, ITT, smoke, ...

▲ WARNING **▲**

No air start attempt after an engine fire.

► Fly the airplane ◀

1 -	Oxygen masks	Use
2 -	THROTTLE	CUT OFF
3 -	AUX BP switch	OFF
4 -	FUEL TANK SELECTOR	OFF
5 -	BLEED switch	OFF/RST
6 -	A/C switch	OFF
If ned	cessary:	
	7 - Perform procedure	. Emergency descent Refer to chapter 3.6
8 -	Perform procedure	Forced landing Refer to chapter 3.7
		End of procedure.

Cabin electrical fire or smoke during flight

► Fly the airplane ◀

1 -	Оху	gen masks and goggles
If the	origin	is known :
	2 -	Defective equipment breaker
	3 -	Cabin extinguisher Use
If the	origin	is unknown:
	4 -	A/C switch OFF
	5 -	All unnecessary equipment OFF
6 -	Perfo	orm procedure Emergency descent Refer to chapter 3.6
If ned	essar	y:
	7 -	Perform procedure
		► Land as soon as possible ◀

Smoke elimination

1 -	Oxygen masks and goggles
2 -	BLEED switch OFF / RST
3 -	A/C switch OFF
4 -	DUMP switch Actuate
5 -	Wait until the differential pressure drops.

Maximum range descent 2/2 ▶ Continuing If icing conditions: 20 -PITOT L HTR switch ON 21 -WINDSHIELD switch ON Airspeed Above 135 KIAS 22 -Configuration flaps UP If time permits: 23 -AIR COND breaker Pull Prepare for Forced landing 25 -Refer to chapter 3.7 End of procedure.

3.7 - Emergency landings, flaps, gear

Forced landing

1 -	THRO	OTTLE CUT OFF
2 -	FUEL	TANK SELECTOR OFF
3 -	AUX I	BP switch OFF
4 -	BLEE	D switch OFF / RST
5 -	A/C sv	vitch OFF
6 -	DUMP	switch Actuate
7 -	Gliding	g airspeed
8 -	ESS B	SUS TIE switch NORM
		To have GEAR and FLAPS available
If lan	ding sur	face is suitable :
	9 -	LANDING GEAR lever
If landing surface is not suitable :		
	10 -	LANDING GEAR lever Keep UP
If nig	ht condi	itions:
	11 -	OFF/TAXI/LDG switch
Whei	n chose	n landing surface is assured :
	12 -	FLAPS lever LDG
	13 -	Crash lever Pull down
	14 -	Airspeed on final approach
	15 -	Land flaring out.
	16 -	Evacuate after stop.
		End of procedure.

Tire blowout during landing

1 -	Control direction with brakes and nose wheel steering.
2 -	Reverse As required
3 -	Stop airplane to minimize damages.
4 -	Perform procedure
	End of procedure.

FLAPS ASYM

Indicates a dissymmetry of flap deflection. This immediately stops the flap motor and prevents further operation of the flaps.

► Fly the airplane ◀

1 -	FLAPS breaker	Pull
2 -	FLAPS lever	UP

► Land as soon as possible ◀

- 3 Maintain airspeeds:
 - IAS < 178 KIAS for deflections between UP and TO positions
 - IAS < 122 KIAS for deflections greater than TO position
- 4 For landing, refer to procedure Landing with flaps malfunction

 Refer to procedure on following page

Flaps malfunction

In case of blockage of flaps or inoperative flaps control lever between UP and LDG positions, without FLAPS ASYM:

1 -	FLAPS breaker	Pull
2 -	FLAPS lever	. UP

► Land as soon as possible ◀

- 3 Maintain airspeeds
 - IAS < 178 KIAS for deflections between UP and TO positions
 - IAS < 122 KIAS for deflections greater than TO position
- 4 For landing, refer to procedure Landing with flaps malfunction

 Refer to procedure hereafter

End of procedure.

Landing with flaps malfunction

For flaps deflections between UP and TO:

Proceed as for a normal landing with 105 KIAS of approach airspeed.

Provide for a landing distance increased by 60 %.

For flaps deflections greater than TO:

Proceed as for a normal landing with 100 KIAS of approach airspeed.

Provide for a landing distance increased by 50 %.

Landing gear retraction discrepancy

NOTE •

Symptoms have to be considered at the end of the sequence.

Symptoms:

- GEAR UNSAFE CAS msg and GEAR UNSAFE red warning light are ON, or
- amber light flashing and 3 green lights are OFF.
- 1 Airspeed Maintain below 150 KIAS
- 2 LDG GEAR breaker Pull

If GEAR UNSAFE CAS msg and GEAR UNSAFE red warning light are OFF:

3 - The flight may be continued without any restriction.

For landing gear extension:

4 - Perform procedure Emergency gear extension Refer to following procedures

End of procedure ■

If not:

- 5 LDG GEAR breaker Push
- 6 Perform procedure Emergency gear extension Refer to following procedures

Landing gear extension discrepancy

NOTE •

Symptoms have to be considered at the end of the sequence.

Symptoms:

- CAS msg and GEAR UNSAFE red warning light are ON, or
- amber light flashing and 0 to 3 green lights are OFF.
- Airspeed Maintain below 150 KIAS 1 -
- Perform procedure Emergency gear extension 2 -Refer to procedure on following page

Emergency gear extension

1/3

NOTE •

Follow this procedure in case of any doubt about the gear extension.

▲ CAUTION ▲

Do not enter icing conditions. This could adversely increase drag and weight due to ice accumulation, and lock wheels and struts.

Climb performance will be degraded by 50 %.

Cruise IAS speed will be reduced compared to a clean airplane, because of the drag.

This should be taken into account when calculating the airplane range.

1 -	Airspeed
2 -	LANDING GEAR lever
3 -	LDG GEAR breaker Pull
4 -	Floor hatch Open
5 -	By-pass selector Fully pull / Locked
	▲ CAUTION ▲ te entire extension of the landing gear may take up to 110 cycles. It is andatory to have a clear hardening of the manual control at the end of the maneuver.
6 -	Landing gear emergency pump handle
7 -	MASTER WARNING push-button Press
	To reset the GEAR UNSAFE
	Continue ►

Emergency gear extension

2/3

▶ Continuing

If:

- GEAR UNSAFE red warning light is OFF and
- GEAR UNSAFE is OFF and
- 3 green lights are ON:
 - 8 Exit and / or remain outside icing conditions.

Continue flight at airspeed < 178 KIAS.

► Land as soon as practical ◀

End of procedure ■

If:

- GEAR UNSAFE red warning light is ON and
- GEAR UNSAFE is ON and
- 0 to 3 green lights are ON:
 - 9 LDG GEAR breaker Push
 10 CHECK DOWN push-button Press

If:

- hardening of the pump is marked and
- 3 green lights are ON or
- 3 green lights are ON and flickering while pressing the CHECK DOWN push-button:
 - 11 Land

- End of procedure
 - Continue ▶

Emergency gear extension

3/3

▶ Continuing

If:

- emergency pump remains soft or
- one (or more) green light(s) is(are) not ON and / or flickering while pressing the CHECK DOWN push-button:

A gear unlock condition is confirmed.

Recycle the landing gear as follows:

- By-pass selector Unlock / Push 12 -
- 13 Wait one minute.
- 14 LANDING GEAR lever UP At airspeed < 150 KIAS
- Perform landing gear extension attempts in the normal mode while applying positive load factors during the maneuver as well as skidding.

In case of failure:

Perform procedure Landing with unlocked main landing gear or Landing with defective nose landing gear Refer to following procedures

If one main landing gear is not down, it is recommended to land with landing gear up - refer to procedure Landing with gear up in the following procedures.

Landing with unlocked main landing gear

1/2

▲ CAUTION ▲

If one main landing gear is not down, it is recommended to land with landing gear up - refer to procedure Landing with gear up in the following procedures.

Ask ATC or another airplane to visually check landing gear position.

If defective gear is down but unlocked:

- BLEED switch OFF / RST 2 -3 -DUMP switch Actuate
 - 4 -FUEL TANK SELECTOR Maintain on defective LDG gear side
 - To lighten corresponding wing (maximum fuel imbalance 15 USG)
 - 5 -Choose a runway with headwind or crosswind blowing from defective gear side.
 - Align the airplane to land on the runway edge opposite to the defective 6 landing gear.
 - 7 -Perform a normal approach.
 - 8 -FLAPS lever LDG At airspeed = 90 KIAS
 - 9 -Land and set nose gear immediately on ground to assure lateral control.
 - Use full aileron during roll-out to lift the wing with the defective landing 10 gear.

Continue ▶

Landing with unlocked main landing gear 2/2

▶ Continuing

If landing gear drags during landing:

11 -	THROTTLE	CUT OFF

- 12 Crash lever Pull down
- 13 FUEL TANK SELECTOR OFF
- 14 Evacuate after airplane comes to a stop.

End of procedure ■

If landing gear does not drag during landing:

- 15 Preferably do not use reverse.
- 16 Complete taxiing with a slight turn towards defective landing gear.
- 17 THROTTLE CUT OFF
- 19 Evacuate.

Landing with defective nose landing gear (down unlocked or not down)

1 -Ask ATC or another airplane to visually check landing gear position.

If necessary:

- Transfer passengers to the rear.
- 2 -Perform a normal approach.
- 3 -FLAPS lever LDG
- 4 -Airspeed Maintain 90 KIAS
- Land with nose-up attitude. Keep nose high. 5 -
- 6 -THROTTLE CUT OFF
- 7 -Touch down slowly with nose wheel and keep elevator at nose-up stop.
- 8 -Brakes Apply moderately
- 9 -Crash lever Pull down
- 10 -FUEL TANK SELECTOR OFF
- 11 -Evacuate after airplane comes to a stop.

Landing with gear up

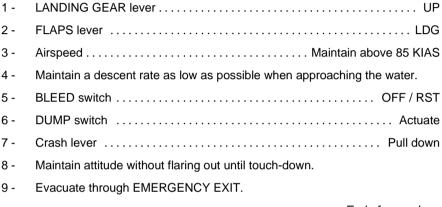

1 -	Do a standard final approach.		
2 -	FLAPS lever LDC		
3 -	Airspeed Maintain 85 KIA		า 85 KIAS
4 -	BLEED switch OFF / RS		FF / RST
5 -	DUMP switch Actua		. Actuate
Wher	runw	vay is assured :	
	6 -	THROTTLE	CUT OFF
	7 -	FUEL TANK SELECTOR	OFF
	8 -	Flare out.	
After	touch-	-down:	
	9 -	Crash lever	Pull down
	10 -	Evacuate after airplane comes to a stop.	

Ditching

▲ CAUTION ▲

In heavy swell with light wind, land parallel to the swell (rollers). In heavy wind, land facing wind.

		Landing without elevator control
1 -	LANI	DING GEAR lever
2 -	FLAF	PS lever
3 -	Airsp	eed Maintain 95 KIAS
4 -		
5 -	Adjus	st elevator by using manual pitch trim wheel.
Whe	n grou	nd approaches :
	6 -	Slope Decrease progressively
	7 -	TRQ Reduce progressively
		End of procedure.

3.9 - Electrical system

ESI-2000 failures 1/2

Battery indicator symbol meaning

Battery indicator	Description
Not shown	Normal operation - No information needs to be conveyed
Green	More than one hour of operation remains
Amber	Less than one hour of operation remains
Amber "X"	Battery is not available to power unit : overtemperature or low battery voltage condition exists
Red "X"	Battery has failed - Service is required

ESI-2000 attitude invalid in flight:

1 -	Maintain	straight a	and level	flight at	a constant	airsneed
1 -	Manitani	Straight c		mgm at	a constant	an specu.

2 - M button Press twice

3 - S button Press once

The ESI-2000 will initiate the alignment process.

When a normal attitude display is available:

4 - Resume normal flight.

If attitude information remains invalid:

5 - Use attitude information from the primary attitude display.

End of procedure ■

Red X'd battery symbol displayed in flight:

Indicates internal battery failure.

Remain clear of IMC.

Continue ▶

ESI-2000 failures

2/2

▶ Continuing

If in visual meteorological conditions:

- 2 Cycle power on ESI-2000, including internal power.
- 3 Maintain straight and level while unit aligns.

If red "X" reappears:

4 - Remain clear of IMC.

End of procedure ■

Amber X'd battery symbol displayed in flight:

Indicates internal battery is not available. Battery temperature above 55°C.

- 1 Reduce temperature of cockpit environment.
- 2 Remain clear of IMC until amber "X" is removed from the display.

End of procedure ■

Amber battery symbol displayed in flight:

Indicates the internal battery state of charge is low.

1 - Remain clear of IMC until amber battery symbol is removed from the display signifying battery is charged sufficiently to have one hour of discharge abilitiy.

End of procedure ■

ESI-2000 in-flight shutdown (manual procedure):

- 1 Maintain control of the airplane using airplane primary instruments.
- 3 Press any key (button) as stated by the on screen message.

BAT AMP

Indicates that battery current is over 50 A while on ground.

After starting the engine with airplane power, a battery charge over 50 amperes is normal.

Do not take off if battery charge is over 50 A.

 \blacktriangle

If this indication remains steady at a high value:

It may be due to a battery or generation system failure.

End of procedure.

BAT OFF

Indicates that:

- the SOURCE selector has been positioned on OFF or
- the battery plug is disconnected

4 - Perform procedure Emergency descent Refer to chapter 3.6
End of procedure.

Cabin not depressurized after landing

If ΔP cabin remains > 0:

1 -	DUM	P switch Actuate
2 -	BLEE	ED switch OFF / RST
If nec	essar	<i>y</i> :
	3 -	EMERGENCY RAM AIR control knob Pull
4 -	Wait	for complete cabin depressurization before opening any door.
		End of procedure

Indicates that the oxygen cylinder isolation valve is closed.

▲ WARNING ▲

Flight is prohibited with oxygen cylinder closed.

1 - Oxygen cylinder Open

End of procedure.

Indicates that one of the door latches of the door(s) is not correctly locked.

On ground:

Check the correct locking, as well as the latches position of the door(s).

is still ON:

2 -Do not take off

End of procedure ■

In flight:

► Fly the airplane ◀

- Start a slow descent. 3 -
- 4 -Decrease cabin pressure differential By selecting a higher cabin altitude and maximum cabin rate

If a real failure of one of the doors is noticed:

5 -	Oxygen masks Use
6 -	BLEED switch OFF / RST
7 -	DUMP switch Actuate
If nec	cessary:

8 -Perform procedure Emergency descent Refer to chapter 3.6

VACUUM LOW

Low vacuum may lead to malfunctioning of leading edge deicing and pressurization.

1 - Monitor the normal functioning of leading edge deicing and pressurization.

If necessary:

- 2 Altitude Below 10000 ft
- 3 Return to VMC conditions as soon as possible.
 - ► Fly the airplane ◀
- 4 BLEED switch OFF / RST

Defog malfunction

If moisture starts to quickly cover the inside of the windscreen with the HOT AIR FLOW distributor already turned to the left:

1 - HOT AIR FLOW distributor Set to around a 10 o'clock position

If moisture continues:

- 2 HOT AIR FLOW distributor Turn to the left
- 3 WINDSHIELD switch ON

If there is no improvement and if the flight safety is engaged:

- 4 Altitude Around 10000 ft
- 5 BLEED switch OFF / RST

▲ CAUTION ▲

In flight, the cabin will quickly depressurize. Therefore, the cabin vertical speed indicator and altimeter indications will rapidly meet those of respectively the airplane VSI and altimeter.

End of procedure.

3.11 - Deicing system

Leading edges deicing failure

Symptoms: failure on one of the two pneumatic deicing pulses:

- ice on wing outboard sections,
- or, ice on wing inboard sections and stabilizers,
- one of the two cycling green lights is not lit.
- ► Leave icing conditions as soon as possible ◀
- 1 AIRFRAME DE ICE switch OFF

PROP DEICE FAIL

Symptoms:

- propeller deicing green light is not lit,
- propeller vibrations.

1 -	TRQ Reduce
	► Fly the airplane ◀
2 -	THROTTLE Actuate
	To vary RPM within operating range

► Leave icing conditions as soon as possible ◀

INERT SEP FAIL

Symptoms:

- INERT SEP ON does not appear within 50 seconds following INERT SEP switch setting ON,
- inertial separator is not retracted after 50 seconds following INERT SEP switch setting OFF,
- INERT DE ICE breaker triggered.

► Leave icing conditions as soon as possible ◀

► Fly the airplane ◀

>> Before ECS AUTO mode removal (Pre-MOD70-0529-21)

Windshield deicing failure

Symptoms:

- windshield being covered uniformly by ice,
- no perception of heat when touching deiced section,
- windshield deicing green light is not lit.

If symptoms result from overheat:

WINDSHIELD switch OFF / ON When necessary

In case of total failure:

- 2 -TEMP/°C selector Max warm
- HOT AIR FLOW distributor Turn to the left

Before landing:

Wait for a sufficient visibility. 4 -

>> After ECS AUTO mode removal (Post-MOD70-0529-21)

Windshield deicing failure

Symptoms:

- windshield being covered uniformly by ice,
- no perception of heat when touching deiced section,
- windshield deicing green light is not lit.

If symptoms result from overheat:

1 - WINDSHIELD switch OFF / ON When necessary

In case of total failure:

- 2 TEMP selector Max warm
- 3 HOT AIR FLOW distributor Turn to the left

Before landing:

4 - Wait for a sufficient visibility.

>> Before ECS AUTO mode removal (Pre-MOD70-0529-21)

Windshield misting or internal icing

Symptoms: mist or ice on windshield internal face. 1 -TEMP/°C selector Set to 12 o'clock position 2 -HOT AIR FLOW distributor Turn to the left 3 -WINDSHIELD switch ON If unsuccessful, to get sufficient visibility: 4 -HOT AIR FLOW distributor Fully turn to the left Manually clean a sufficient visibility area. If necessary:

▲ CAUTION ▲

In case of sideslip approach with pedal on the right during a long period, select R.H. fuel tank.

- Clean L.H. side window. 6 -
- 7 -Perform a sideslip approach with rudder pedals to the right. To get sufficient landing visual references

For landing:

- 8 -FLAPS lever LDG
- 9 -Airspeed Maintain above 95 KIAS

>> After ECS AUTO mode removal (Post-MOD70-0529-21)

Windshield misting or internal icing

▲ CAUTION ▲

In case of sideslip approach with pedal on the right during a long period, select R.H. fuel tank.

- 6 Clean L.H. side window.
- 7 Perform a sideslip approach with rudder pedals to the right.
 To get sufficient landing visual references

For landing:

- 8 FLAPS lever LDG
- 9 Airspeed Maintain above 95 KIAS

PITOT NO HT L-R

Indicates:

- a heating failure of the corresponding probe or
- PITOT L HTR switch or PITOT R & STALL HTR switch not ON while engine is running.

If PITOT NO HT L:

Icing conditions may alter airspeed indications provided by ADC1.

Avoid icing conditions.

► Fly the airplane ◀

If not possible:

2 - Perform moderate descent or climb attitudes.

V_{MO} overshoot and stall warning system are always operating.

End of procedure ■

If PITOT NO HT R

V_{MO} overshoot warning may be altered by icing conditions.

► Fly the airplane ◀

3 - Airspeed Monitor below 266 KIAS

STALL NO HEAT

Correct operation of the aural stall warning may be altered by severe or prolonged icing.

► Fly the airplane ◀

Section 3 Emergency procedures EASA Approved

Intentionally left blank

3.12 - Miscellaneous

	Trim Runaway
	► Fly the airplane ◀
1 -	AP / TRIM DISC push-button Press and hold
The th	hree trim tabs are disconnected and runaway stops.
2 -	AP / TRIMS switch OFF
3 -	AP / TRIM DISC push-button Release
4 -	Pitch trim may be used manually.

In case of pitch trim runaway:

If necessary : 5 - A

Airspeed Reduce

The pitch trim may be used manually, the two other trim tabs may be used again electrically.

End of procedure ■

To reduce control forces

In case of rudder or aileron trim runaway:

7 -	RUD TRIM or AIL TRIM breaker Pull
	According to the defective trim
8 -	AP / TRIMS switch ON

The two other trim tabs may be used again electrically.

Crack in cockpit window or window panel

► Fly the airplane ◀

1 -	Descend slowly.
2 -	Cabin ΔP Reduce
	By setting Landing Field Elevation to 10000 ft

Emergency exit use

- 1 Check that the anti-theft safety pin has been removed.
- 2 Lift up the opening handle.
- 3 Pull emergency exit assembly towards oneself to release it from its recess.
- 4 Put the emergency exit door inside fuselage or throw it away from the fuselage through the opening.
- 5 Evacuate airplane.

Emergency beacon (ELT) use

Before a forced landing:

If possible:

Transmit a MAY DAY signal on COM VHF 121.5 MHz or on a 1 known ATC frequency.

After landing:

2 -Maintain ON until aid arrives

Inadvertent spins

▲ WARNING ▲

Voluntary spins are prohibited.

 \blacksquare

1 -	Control wheel
2 -	Rudder Fully opposed to the spin
3 -	THROTTLE Flight IDLE
4 -	FLAPS lever
When	rotation is stopped :
	5 - Level the wings and ease out of the dive.
	► Fly the airplane ◀

GARMIN >> Without v15 11 software and without voice alerts (Pre-MOD70-0407-00C):

Stall warning sound

NOTE •

If stick shaker is installed (Post-MOD70-0510-27), shaker will vibrate simultaneously with stall warning sound.

- 1 -AP / TRIM DISC push-button Press twice
- 2 -Fly the airplane, wings levelled and nose down until stall warning stops.
- 3 -TRQ As required
- 4 -Return to the desired flight path.

End of procedure.

>> With v15.11 GARMIN software and voice alerts (Post-MOD70-0407-00C):

AP off, stall warning

NOTF •

If stick shaker is installed (Post-MOD70-0510-27), shaker will vibrate simultaneously with stall warning aural alert.

If possible:

For rear passengers:

- 1 Take a mask.
- 2 Uncoil tube totally.
- 3 Pull on the lanyard cord to take out the lanyard pin.
- 4 Put the mask onto the face.

>> With v15 GARMIN software (Post-MOD70-0407-00):

Oxygen use

1/2

With or without **USE OXYGEN MASK**

▲ WARNING ▲

Smoking is strictly prohibited any time oxygen system is used. Before using oxygen, remove any trace of oil, grease, soap and other fatty substances (including lipstick, make-up, etc...).

▲

For front seats:

Take a mask on the opposite seat side (pilot: R.H. side: R.H. Front passenger: L.H. side). Draw it out of the stowage cup and uncoil tube totally. 2 -Press on the red side vanes to inflate the harness. 3 -Put the mask onto the face If no smokes: 4 -3-position selector NORMAL 100 % as required In case of smokes: 3-position selector EMERGENCY 5 -Don the smoke goggles onto the face. >> With PASSENGER OXYGEN switch ON/OFF (Pre-MOD70-0485-11A): PASSENGER OXYGEN switch >> With PASSENGER OXYGEN switch STBY/DEPLOY (Post-MOD70-0485-11A): PASSENGER OXYGEN switch DEPLOY

Continue ▶

>> With v15 GARMIN software (Post-MOD70-0407-00):

Oxygen use	2/2
------------	-----

▶ Continuing

>> AII

- 9 Check oxygen flow indicator for the front seats (the blinker is transparent) and for the rear passengers (the blinker is green).
- 10 MICRO/MASK switch MASK

If possible:

12 - Perform an emergency descent To an altitude below 10000 ft

For rear passengers:

- 1 Take a mask.
- 2 Uncoil tube totally.
- 3 Pull on the lanyard cord to take out the lanyard pin.
- 4 Put the mask onto the face.

Airspeed indicating system failure

Symptomo : omonocac malcation in mg	oms : erroneous indication in flight.
-------------------------------------	---------------------------------------

If symptoms persist:

- 3 ALTERNATE STATIC SOURCE selector Pull thoroughly If symptoms persist, as well as on the electronic standby instrument on the L.H instrument panel:
 - 4 Perform a precautionary approach maintaining an adequate airspeed.

Flight into severe icing conditions

Severe icing conditions, particularly freezing rain and freezing drizzle, can be identified by:

- unusually extensive ice accumulation on the airframe and windshield in areas not normally observed to collect ice,
- accumulation of ice on the upper surface of the wing aft of the protected area.

Procedures for exiting freezing rain or freezing drizzle conditions:

- 1 Inform ATC to exit severe icing conditions by changing the route or the altitude.
- 2 Avoid any sudden maneuver on flight controls.
- ▶ Do not engage the autopilot ◀

If the autopilot is engaged:

3 - Hold the control wheel firmly and disengage the autopilot.

If an unusual roll response or uncommanded roll control movement is observed:

- 4 Angle of Attack Reduce
- ▶ Do not extend flaps when holding in icing conditions

Operation with extended flaps can result in a reduced wing Angle of Attack, with the possibility of ice forming on the upper surface further aft on the wing than normal, possibly aft of the protected area.

If the flaps are extended:

5 - Do not retract them until the airframe is clear of ice.

FRONT CARGO DOOR

Indicates th	nat front	cargo	door	is open.	

On ground:

1 - Check and close the door.

In flight:

► Land as soon as practical ◀

End of procedure.

To minimum available

GPU DOOR

Indicates that GPU door is open.

On ground:

1 -Check and close the door.

In flight:

► Fly the airplane ◀

2 -Airspeed Reduce To minimum available

► Land as soon as practical ◀

IGNITION

Indicates that ignition exciter is running.

1 - IGNITION switch Check position

If weather permits:

2 - IGNITION switch AUTO

► Fly the airplane ◀

• NOTE •

IGNITION switch may be left ON for a long period.

AP ON YD OFF

Indicates that the autopilot is ON while Yaw Damper is OFF, so no automatic rudder trim is available. Yaw Damper status Check If necessary: 2 -Yaw Damper status Correct End of procedure.

Autopilot or electric pitch trim malfunction

▲ CAUTION ▲

When disconnecting the autopilot after a pitch trim malfunction, hold the control wheel firmly. Up to 30 pounds of force on the control wheel may be necessary to hold the airplane level.

AP / TRIM DISC push-button Press and hold 1 -2 -AP / TRIMS switch OFF 3 -AP / TRIM DISC push-button Release If necessary: 4 -Control wheel Retrim

Dual GPS/SBAS failure

(DR or LOI annunciation on HSI) 1/2

LOSS OF GPS/SBAS NAVIGATION DATA

When both GPS/SBAS receivers are inoperative or GPS navigation information is not available or invalid, the GARMIN system will enter one of two modes: Dead Reckoning mode (DR) or Loss Of Integrity mode (LOI). The mode is indicated on the HSI by an amber DR or LOI.

Which mode is active depends on the distance from the destination airport in the active flight plan.

If the LOI annunciation is displayed, revert to an alternate means of navigation appropriate to the route and phase of flight.

In Dead Reckoning mode, the MAP – NAVIGATION MAP will continue to be displayed with a ghosted airplane icon in the center and an amber 'DR' overwriting the icon. Airplane position will be based upon the last valid GPS position, then estimated by Dead Reckoning methods. Changes in true airspeed, altitude, or winds aloft can affect the estimated position substantially. Dead Reckoning is only available in Enroute mode; Terminal and Approach modes do not support DR. Course deviation information will be displayed as an amber CDI on both PFDs and will remain for up to 20 minutes after GPS position data has been lost. The autopilot and/or flight director may be coupled in GPS mode while the system is in Dead Reckoning mode.

Refer to the GARMIN Cockpit Reference Guide for further information.

 $Revert \, to \, an \, alternate \, means \, of \, navigation \, appropriate \, to \, the \, route \, and \, phase \, of \, flight.$

If Alternate Navigation Sources (ILS, LOC, VOR, DME, ADF) are available :

1 - Navigation USE ALTERNATE SOURCES

Continue ▶

2/2

Dual GPS/SBAS failure (DR or LOI annunciation on HSI)

Continuing

If no Alternate Navigation Sources are available:

Dead Reckoning (DR) Mode - Active when the airplane is greater than 30 NM from the destination airport :

NOTE •

All information normally derived from GPS turns amber. All of this information will become less accurate over time.

TAWS is inoperative.

DR mode uses heading, true airspeed, last known wind data, and the last known GPS position to estimate the airplane current position. DR information will be available for a maximum of 20 minutes.

MAP – TRAFFIC MAP display is not dependent on GPS information. The position of displayed traffic relative to the airplane symbol on the map is still accurate.

•

Loss Of Integrity (LOI) Mode - Active when the airplane is within 30 NM of departure airport (as calculated from the previous GPS or DR position)

NOTE •

All information derived from GPS or DR will be removed from the displays. TAWS is inoperative.

The airplane symbol is removed from all maps. The map will remain centered at the last known position. NO GPS POSITION will be annunciated in the center of the map.

•

GPS approach alarm limits exceeded

During a GPS LPV, LNAV/VNAV, or LNAV+V approach, if the Horizontal or Vertical alarm limits are exceeded, the GARMIN System will downgrade the approach. This will be annunciated in the ALERTS window and by an annunciation change on the HSI from LPV, L/VNAV, or LNAV+V to LNAV. GPS glide path vertical guidance will be removed from the PFD.

The approach may be continued using the LNAV only minimums.

During any GPS approach in which both precision and non-precision alarm limits are exceeded, the GARMIN System will flag the lateral guidance and display a system message ABORT APPROACH loss of navigation.

Immediately upon viewing the message, the unit will revert to Terminal navigation mode alarm limits. If the position integrity is within these limits, lateral guidance will be restored and the GPS may be used to execute the missed approach, otherwise alternate means of navigation must be utilized.

Left PFD failure

► Fly the airplane ◀

At takeoff:

In flight:

▲ CAUTION ▲

In case of ILS approach, don't forget to select LOC2 on CDI source.

Use of reversionary mode will report left PFD information on MFD and disable supplementary functions as stormscope,...

In reversionary mode, the weather radar system automatically switches to standby mode and the weather radar system cannot be controlled. The system remains in standby mode until both displays are restored.

4.1 - General

This section provides procedures for the conduct of normal operation of TBM airplane.

The first part of this section lists the normal procedures required as a check list.

The amplified procedures are developed in the second part of the section.

The normal procedures for optional systems are given in section 9, Supplements of the POH.

Section 4 Normal procedures EASA Approved

• NOTE •

Within 10 minutes following the engine shutdown, check engine oil level.

Refer to chapter 8.7 Oil level check.

End of procedure.

Section 4 Normal procedures EASA Approved

Intentionally left blank

4.4 - Amplified procedures

Preflight inspection

1/16

The preflight inspection procedure is based on a scanning method.

It is divided in 6 subparts to cover all items of the preflight - see figure 4.4.1

- I Initial inside inspection
- II Cabin
- III L.H. Wing
- IV Fuselage forward section
- V R.H. Wing
- VI Fuselage rear section / Empennages

▲ WARNING ▲

During outside inspection, visually check inspection doors and airplane general condition. Check for systems and parts attachments / deflections / leaks / cracks / deteriorations / non-obstructions / nicks / numbers / free movements / position.

In cold weather, remove even small accumulations of frost, ice or snow from wing, tail and control surfaces.

In case of night flight, check good operation of all navigation lights, landing lights, strobe lights and make sure that an emergency lamp is on board.

If icing conditions are foreseen, particularly check good functioning of all electrical and pneumatic ice protection systems.

Check that type and quantity of fuel used for refueling are correct.

Remove covers on : pitots (2), static ports (3), engine air inlet and propeller locking (1).

Preflight inspection

2/16

▶ Continuing

▲ WARNING ▲

Remove tie-downs.

Refer to section 8 for quantities, products and specifications of products and materials currently used.

Preflight inspection 6/16 Continuing 39 -SOURCE selector BATT or GPU 40 -Standby instrument battery indicator symbol Not displayed If a battery symbol appears on the standby instrument display, airplane takeoff is not allowed until the situation is resolved. Refer to the battery details in the standby instrument Pilot's guide for further information. If BATT source: Voltage Check > 24.5 volts NOTE • If not, use a GPU or charge battery. This minimum voltage is not an absolute quarantee for a correctly charged battery. It is recommended to use a GPU in cold weather, when airplane has been stopped more than 3 hours at a temperature below - 10°C (+ 14°F). If GPU source: ▲ CAUTION ▲ Low voltage (around 24.5 V) may indicate that only the battery is powering the airplane and not the pair GPU + battery. Make sure that a GPU is connected and powering the airplane. • NOTE • If using a GPU, ensure that it provides a 28-volt regulated voltage, with negative on earth, as well as it supplies 800 amps minimum and 1000 amps maximum. See placard located near ground power receptacle door. EXT LIGHTS panel 43 - OFF/TAXI/LDG switch OFF 44 -STROBE switch ON 45 -NAV switch ON

>> All

73 - Doors operation Check

Outside inspection

The preflight inspection described in figure 4.4.1 is recommended before each flight.

• NOTE •

If a preflight inspection is performed just after the engine shutdown, be careful because the leading edge of engine air inlet, as well as exhaust stubs may be very hot.

•

If the airplane was in long term storage or if it has undergone major maintenance or if it has been used from emergency airfields, a thorough outside inspection is recommended.

When the airplane is stored outside, the use of the flight control lock and blanking covers is recommended. Propeller should be tied down to prevent rotation without oil pressure.

When the airplane is stored for extended periods of time, a thorough preflight inspection is recommended. Particular attention should be paid to possible blockages in airspeed sensing lines, foreign objects in engine intake and exhaust stubs and water contamination of the fuel system.

Preflight inspection 10/16 Continuing L.H. wing (III) 75 -Also inspect the lower surface, as well as flap fairing, where pebbles (and even ice in case of slush on the runway) may have accumulated. 76 -Aileron and trim / Spoiler Condition / Free movement / Deflection NOTE • Ensure there are no foreign objects in the spoiler recess. When ailerons are in the neutral position, it is normal that spoilers are lightly extended at upper surface. 77 -Trailing edge static discharger Condition / Number / Attachment 78 -Winglet / nav. lights / strobe / landing light / 79 -80 -NOTE • Fuel tank caps must be tight (which is characterized by a consequent exertion to lock and unlock them) to avoid water infiltration in case of rain on ground. and to avoid fuel loss in flight. NOTE • Air vent is not likely to be obstructed by ice or water, as it is located in a wing lower surface recess. Continue ▶

Preflight inspection	11/16
► Continuing	
82 - Left pitot	Condition
83 - Wing lower surface	No leak
84 - Check fuel tank access doors for leaks.	
85 - Check for surface damage.	
86 - Wing deicer boots	Attachment
● NOTE ● Care must be taken when refuelling the airplane to avoid damaging deicer boots. A protective apron should be used if possible. ●	
87 - Fuel tank drain (two on each wing)	
● NOTE ● In case of water in fuel system, drain it carefully using the four drain tank sumps, and the fuel filter drain valve, till every trace of water or disappeared. A long term storage of the airplane causes water accumulation in fur absorbs additive. This phenomenon occurs when an excessive quare water accumulates in fuel tank sumps. Refer to section 8 for service operations relative to fuel additives.	eposit has el, which antity of
L.H. main LANDING GEAR	
88 - Shock absorber	Check
89 - Doors	Check
90 - Tire	Check
91 - Wheel well	Check
	Continue ►

Preflight inspection

12/16

▶ Continuing

NOTE •

If airplane has been used from muddy airfields or in snow, check wheel wells to make sure they are clean and not obstructed.

Check frequently all landing gear retraction mechanism components, shock-absorbers, tires and brakes. This is particularly important for airplanes used from hilly fields.

Improperly serviced or worn shock-absorbers may result in excessive loads being transmitted to the airplane structure during ground operations. Without passengers and baggages on board, the unpainted surface of the main gear shock absorber tube must be visible about:

55 mm (2.17 in) of minimum height with half tank, 40 mm (1.57 in) of minimum height with full tanks.

Fuselage forward section (IV

Forward compartment

95 -	Fuel	circuit di	rain	 	 					Dra	

▲ WARNING ▲

If the clogging indicator is extended, red collar visible, the flight is not authorized.

96 -	Filter contamination indicator (clogging indicator)	Check
97 -	L.H. exhaust stub	Condition / No cracks

Preflight inspection

13/16

Continuing

NOTE •

Inspect if possible pressure port located inside exhaust stub. A missing port or a cracked port may hinder correct operation of continuous heating of air inlet lip.

Check for no cracks, which are sometimes put in evidence by traces of soot resulting from exhaust gases.

104 - Lateral / upper Unobstructed

• NOTE •

Lateral air inlets, which supply air conditioning system and oil cooler, are provided with blanking covers. It is not the case for upper air inlets of RAM AIR system (circular grille located in front of R.H. windshield) and of vapor cycle cooling system (two rectangular grilles located forward of the circular grille).

Preflight inspection 14/16

Continuing

105 - Propeller and spinner No nicks, cracks or oil leaks / Attachment

NOTE •

In case of operation from contaminated runways, it is necessary to carefully examine propeller blades, where traces of abrasion may be found. Propeller damage may reduce blade life time and degrade performance. Any propeller damage should be referred to maintenance personnel.

Nose gear

 106 - Shock absorber
 Check

 107 - Doors
 Check

 108 - Tire
 Check

NOTE •

Without passengers and baggages on board, the unpainted surface of the nose gear shock absorber tube must be visible about :

57 mm (2.22 in) of minimum height with full tanks,

63 mm (2.46 in) of minimum height with half tank.

NOTE •

Crush or relieve the shock absorber one time or twice before the inspection to remove possible sticking.

In case of doubt, request a check of the shock absorber pressure.

Engine start

2/3

Continuing

When THROTTLE is positioned on LO-IDLE before having obtained 13 % of Ng, there is a risk of overtemperature further to an excessive accumulation of fuel inside the combustion chamber before ignition.

NOTE •

In case of starting with high residual ITT, an ITT decrease below 150°C (within starter operation limits) may allow to stay within the allowed ITT envelope during startup sequence.

•

When

- Ng about 13 % and,
- ITT below 150°C and,
- time below 20 seconds :

2 - THROTTLE LO-IDLE

Abort starting procedure if:

- No ignition 10 seconds after having positioned THROTTLE to LO-IDLE,
- lights on (max ITT < 870°C for more than 20 seconds, < 1000°C for more than 5 seconds),
- Ng < 30 % after 30 seconds of starter use,
- Ng < 50 % after 60 seconds of starter use,

 - 14 IGNITION switch OFF or AUTO

When ITT < 850°C:

15 - STARTER switch ABORT

End of procedure ■

Engine start

End of procedure.	

1/3

Motoring

To drain fuel accumulated inside the combustion chamber, a motoring procedure is required following an aborted start.

A 15-second dry motoring run is sufficient to clear any fuel pooled in the engine. The fuel is removed in liquid or vapor form, through an airflow intended to dry combustion chamber, turbines and exhaust nozzles.

To improve cooling of the bearing cavities and prevent oil coking after shutdown in high OAT [above 35°C (95°F)] environment, it is recommended to perform a 30-second dry motoring run.

It is possible that no trace of drainage be observed under engine, due to the drainage collector intended to prevent parking area from contamination.

▲ CAUTION ▲

After any starting interrupt procedure, wait for engine total shutdown and wait at least 30 seconds before initiating a motoring.

Engine controls

7 -

▲ CAUTION ▲ Observe TRQ / Ng / Np / ITT / OIL T° and PSI limitations. Use optimum torque and / or refer to tables in chapter 5.8.		
4 -	TRQ adjustment / ITT / Ng Check	
• NOTE •		
Torque setting during climb must be adjusted according to engine operation tables in chapter 5.8. These tables give the max. climb power torque setting (MXCL). For each engine, when torque is reduced below 100 % at high altitude according to the tables, during the final climb, reaching the maximum permitted Ng (104 %) is possible and the ITT will be approximately constant, giving a particular value of ITT.		
For a simplified engine operation during climb, power may be set first of all by torque, using 100 %, then, when the ITT typical value for climb is reached, by indicated ITT, using this particular value. The margin between this indicated ITT and 790°C (recommended ITT limit during continuous operation) will gradually reduce as flight time is performed.

With AP engaged :		
4 - Approac	:h airspeed	Above 85 KIAS
	• NOT	—
This is to avoid an	y vertical deviation in o position in sh •	case of late FLAPS extension to LDG hort final.
On final approach un	til landing is assured :	
5 - TRQ		Maintain a minimum of 10 % To ensure positive and rapid engine response to THROTTLE movement
6- AP/YD		Disconnect Before 200 ft
	• NOT	E ●

The pilot effort required to use the rudder pedals is reduced if the yaw damper is turned off. This is particularly significant when landing in a crosswind.

Landing

▲ WARNING ▲

Reduce power smoothly.

Quickly reducing the power to idle during the flare may induce a pronounced deceleration which may lead to a drop down of the airplane.

 \blacktriangle

1 - THROTTLE Flight IDLE

• NOTF •

Avoid three-point landings. Adopt a positive flight attitude in order to touch runway first with main landing gear.

After wheels touch:

▲ CAUTION ▲

On snowy or dirty runway, it is better not to use reverse below 40 KIAS.

▲

NOTE •

To avoid ingestion of foreign objects, come out of the reverse range as speed reduces and use the brakes if necessary for further deceleration.

• NOTE •

High power reverse at low speed can throw loose material into the air, and can cause control problems and decrease the comfort of crew and passengers. If permitted by the runway length, it is better to adopt a moderate reverse.

NOTE •

It is advised not to brake energetically, as long as speed has not reached 40 KIAS, as otherwise wheels may be locked.

▲ CAUTION ▲

In case of high OAT [above 35°C (95°F)], it is required to perform 30 sec dry motoring run after shutdown to improve cooling of the bearing cavities and minimize oil coking - refer to procedure Motoring.

Shutdown stand-by instruments

ESI-2000 normal shutdown procedure:

No pilot action required for normal shutdown. The ESI-2000 will shut down within 5 minutes.

ESI-2000 manual shutdown procedure:

NOTE •

The ESI-2000 can be manually shut down when in the discharge mode to conserve battery power.

- Remove all airplane power from the ESI-2000. 24 -
- 25 -Press any key as stated by the on screen message.

Shutdown 3/3

► Continuing

- 26 Press the M key repeatedly until shutdown menu is shown.
- 27 Press and hold the + key until SHUTTING DN message is shown in the upper left corner of the screen.

Outside check after shutdown

Oxygen cylinder (R.H. Karman) Close 1 -

• NOTE •

Within 10 minutes following the engine shutdown, check engine oil level. Refer to chapter 8.7 Oil level check.

4.5 - Particular procedures

NOTE •

The procedures and procedure elements given in this chapter Particular procedures supplement the normal procedures or complete certain elements of the normal procedures described in chapter(s) 4.3 and/or 4.4.

Flight into known icing conditions

1/5

The stall warning system does not function properly in icing conditions and should not be relied upon to provide adequate stall warning in icing conditions and after leaving icing conditions, if ice accretion remains on the airplane.

General

Icing conditions exist when the OAT on the ground or in flight is $+5^{\circ}$ C or below, and visible moisture in any form is present (clouds, fog with visibility of one mile (1.6 km) or less, rain, snow, sleet or ice crystals).

Icing conditions also exist when the OAT on the ground is + 5°C or below and when operating on ramps, taxiways or runways where surface snow, ice, standing water or slush may be ingested by the engine or freeze on engine or cowlings.

NOTE •

Refer to figure 5.5.1 to convert OAT to SAT in flight. $SAT = OAT - 2^{\circ}C$ on the ground.

Flight into known icing conditions is authorized when all airplane equipment provided for ice protection is operating correctly. This includes :

- Pneumatic deice system for inboard and outboard wing, for stabilizers and for elevator horns.
- Propeller electrical deice system.
- Electrical heating system for both pitots and for the stall warning incidence sensor.

Flight into known icing conditions

2/5

Continuing

- Windshield electrical deice system.
- Inertial separator.

Description of deice systems is presented in chapter 7.13.

Ice accumulation thickness is monitored by the pilot on the L.H. wing leading edge.

At night, a leading edge icing inspection light located on the fuselage L.H. side, activated by the ICE LIGHT switch, is provided.

Boots are automatically cycling at the optimum time to assure proper ice removal. Correct operation of the system can be checked observing the corresponding green advisory light illumination at each boot inflation impulse. If correct operation cannot be confirmed, do not enter or leave as soon as possible icing conditions.

Perform emergency procedure Leading edges deicing failure, paragraph 3.11.

Ice protection procedures

Should conditions require it, apply these directives from beginning of taxi onwards

Prior to entering IMC, as a preventive and if $OAT < 5^{\circ}C$:

▲ CAUTION ▲

Inertial separator position affects engine parameters, particularly TRQ and ITT. Care must be exercised when operating the inertial separator or when increasing power with the inertial separator ON, to avoid exceeding engine limitations.

1 -	INERT SEP switch	ON
2 -	IGNITION switch	ON

NOTE •

IGNITION switch may be left ON for a long period.

INERT SEP switch ON

IGNITION switch ON

Flight into known	icing conditions	4/5

▶ Continuing

12 - WINDSHIELD switch ON

NOTE •

Standby compass indications are altered when windshield deicing system(s) operate(s).

• NOTF •

When OAT is below - 35° C, avoid operations of the AIRFRAME DE ICE system for a too long period because the boots could be damaged. The INERT SEP switch must be left ON while the airplane remains in icing conditions.

▲ CAUTION ▲

If airplane leaves icing conditions, maintain INERT SEP switch to ON as long as ice thickness on non-deiced visible parts exceeds 15 mm (or $\frac{1}{2}$ in).

This will avoid ice fragments coming from propeller spinner and being ingested by engine.

Procedures for holding, approach and landing in icing conditions:

- Minimum recommended airspeeds are :

	We	ight
	< 6579 lbs (2984 kg)	> 6579 lbs (2984 kg)
FLAPS UP	130 KIAS	135 KIAS
FLAPS TO	110 KIAS	115 KIAS
FLAPS LDG	90 KIAS	95 KIAS

- If there is ice on the unprotected surfaces of the airplane, during flight end phase, conduct holding with the flaps up. Use flaps as required for final approach and landing at minimum airspeeds noted above.

Flight into known icing conditions	5/5
------------------------------------	-----

Continuing

Ice accumulation effects

When ice has accumulated on the unprotected surfaces of the airplane, aerodynamic characteristics may be changed.

Particularly stall airspeeds may increase by up to :

FLAPS UP	20 KIAS
FLAPS TO	15 KIAS
FLAPS LDG	10 KIAS

In case of severe or prolonged icing, an ice concretion due to refreezing around the heated stall warning may appear. Above-recommended airspeeds take into account, on one side, the stall airspeed increase due to profile shape deterioration and, on the other side, the weight increase of the iced-up airplane, taking as a basis the airplane maximum weight when not iced-up.

Rate of climb values with ice accumulation on the unprotected surfaces are to be decreased by 10 %.

Cruise airspeeds may be decreased by 10 %, if cruise power is not changed, or more, if cruise power setting should be decreased due to the additional inertial separator limitations (ITT limitation).

Because of the higher landing airspeed, landing distances will be increased. In the landing configuration, using 90 KIAS approach airspeed increases landing distance by 20 % - refer to chapter 5.14 Landing distances.

Flight into severe icing conditions

The following weather conditions may be conducive to severe in-flight icing:

- Visible rain at temperatures below 0°C ambient air temperature,
- Droplets that splash or splatter on impact at temperatures below 0°C ambient air temperature.

Procedures for exiting the severe icing environment

NOTE •

These procedures are applicable to all flight phases from takeoff to landing.

•

Monitor the ambient air temperature. While severe icing may form at temperatures as cold as - 18°C, increased vigilance is warranted at temperatures around freezing with visible moisture present. If the visual cues specified in section 2 Limitations for identifying severe icing conditions are observed, accomplish the following:

- 1 Immediately request priority handling from Air Traffic Control to facilitate a route or an altitude change to exit the severe icing conditions in order to avoid extended exposure to flight conditions more severe than those for which the airplane has been certificated.
- 2 Avoid abrupt and excessive maneuvering that may exacerbate control difficulties.
- 3 Do not engage the autopilot.

If the autopilot is engaged:

4 - Hold the control wheel firmly and disengage the autopilot.

If an unusual roll response or uncommanded roll control movement is observed:

- 5 Angle-of-attack Reduce
- 6 Do not extend flaps when holding in icing conditions. Operation with flaps extended can result in a reduced wing angle-of-attack, with the possibility of ice forming on the upper surface further aft on the wing than normal, possibly aft of the protected area.

If the flaps are extended:

- 7 Do not retract them until the airframe is clear of ice.
- 8 Report these weather conditions to Air Traffic Control.

Flight under heavy precipitations IGNITION switch NOTF • This action is intended, in highly improbable case of an engine flame-out further to an important ingestion, to ensure immediate restarting without action of the pilot. 2 -INERT SEP switch ON End of procedure. Utilization on runways covered with water If takeoff or landing must be performed on a runway covered with water: 1 -IGNITION switch ON 2 -INERT SEP switch ON End of procedure.

Utilization on runways covered with melting or not tamped snow

1/3

If required:

Refer to paragraph Utilization by cold weather and very cold weather.

▲ CAUTION ▲

When engine is shut down, do not set the PROP DE ICE switch to ON, damage to the propeller blades could result.

Preflight inspection:

- Remove any snow or ice from the wings, stabilizers and movable 1 surfaces, landing gear wells and gear doors, as well as flap tracks, actuators and their fairings.
- 2 -Spray anti-icing fluid on the wings, stabilizers and movable surfaces (upper and lower surfaces) and in the landing gear wells, shortly before takeoff.

Preheat the cabin respecting time defined in figure 4.5.2.

Before switching on the navigation and monitoring systems. This allows to respect minimum temperatures necessary for the equipment operation.

Continue ▶

Utilization by cold weather (- 0°C to - 25°C) and very cold weather (- 25°C to - 40°C) - Envelope 3 2/2

Continuing

As soon as the oil temperature is greater than 0°C:

- 11 THROTTLE FEATHER twice
 Flight IDLE to LO-IDLE, then Flight IDLE twice
- 12 Perform normal procedures defined in chapter(s) 4.3 and / or 4.4.

Taxiing / Before line up / Takeoff /

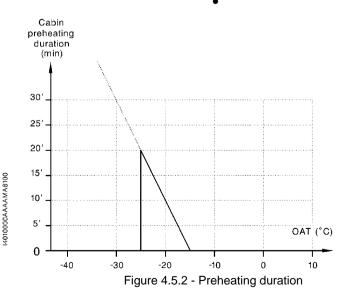

13 - Perform procedures defined for Envelope 1.

Landing / After landing / Shutdown /

14 - Perform procedures defined for Envelope 1.

• NOTE •

If landing is foreseen by cold or very cold weather, or in case of prolonged operation of the airplane in such conditions, it is recommended to prepare the airplane as specified in chapter 8.10.

End of procedure.

Landing procedure with strong headwind or crosswind 1/2

If landing must be performed with strong headwind or crosswind:

1 - Increase approach airspeed by the greatest of these 2 following values:

-
$$\Delta V = \frac{\text{(wind down - 10)}}{2}$$
 (Ex. wind down = 30 kt i.e. $\Delta V = 10$ kt)

The wind down is the longitudinal component of the wind.

- Gust amplitude
- 2 FLAPS lever LDG

• NOTE •

It is not desirable to adopt configuration with flaps in TO position. Lateral control is not improved, and flare phase is lengthened in time and in distance, with increase of piloting difficulties and landing performance.

During approach with crosswind:

▲ CAUTION ▲

Do not use or select the fuel tank on the low wing side during prolonged sideslips with a fuel low warning or gage indicating low.

3 - Maintain airplane in drift correction at the latest until the beginning of flare.

In short final, on a short runway:

- 4 Use normal approach airspeed IAS = 80 KIAS

NOTE •

In this case, landing distance indicated in chapter 5.14, would not be respected.

Before touch-down:

6 - Generate a slideslip with the rudder in order to align fuselage with the runway (ie left crosswind, left wing low).

Continue ▶

Landing procedure with strong headwind or crosswind 2/2

▶ Continuing

Immediately after landing:

▲ CAUTION ▲

Do not try to stabilize the airplane by pushing down the elevator control just after the touch; this operation may provide pitch oscillations while increasing the yaw movement to the wind.

Do not deflect ailerons into wind while taxiing. This will raise spoilers and have a detrimental effect. A good solution is to maintain ailerons to neutral position during taxiing after landing and taxiing before takeoff.

NOTE •

Flaps travel is slow and will not have an appreciable effect on landing performance.

•

Maximum demonstrated crosswind for landing is 20 kt.

The most restrictive situation is as follows:

- takeoff with wind coming from the left,
- wet runway,
- aft C.G.

End of procedure.

Utilization on grass runway

1/2

▲ CAUTION ▲

The small wheels of the airplane and its weight may lead it to sink in soaked or soft ground.

 \blacksquare

Before planning the landing, ensure that the field is hard, smooth and dry enough. Landing and moreover takeoff shall not begin if any doubt exists about the condition of such a runway.

Particular directives

Taxi / Takeoff:

- 1 INERT SEP switch ON
- 2 INERT SEP ON Check ON
- ▶ Do not use the reverse ◀

NOTE •

In fact, on a flat runway with grass, it is necessary to adopt a power greater than the one obtained when the THROTTLE is set to Flight IDLE, so the pilot will not be tempted to use the reverse.

End of procedure ■

Landing:

- 3 INERT SEP switch ON

After wheels touch down:

5 - Reverse Only if necessary

▲ CAUTION ▲

Do not maintain reverse at airspeeds below 40 KIAS to avoid ingestion of foreign matter.

lack

Continue ▶

Utilization on grass runway

2/2

▶ Continuing

• NOTE •

Under 40 KIAS, using the reverse makes a cloud of solid particles (dusts, sand, gravels, cut grass, ...) appear around the front face of the airplane. This will damage the propeller and, after ingestion, the engine internal components (compressor and turbine blades).

•

End of procedure.

GPS navigation

1/2

Set up conditions

- Verify if the data base is current.
- 2 Verify that altitude data is valid for the GPS prior to flight.

In case of B-RNAV use:

During the preflight planning phase, the availability of GPS integrity (RAIM) shall be confirmed for the intended flight (route and time). RAIM computation is automatically done by GARMIN system.

▲ WARNING ▲

B-RNAV flight dispatch shall not be made in the event of a continuous loss of RAIM for more than 5 minutes predicted in any part of the intended flight.

When less than 24 satellites are available (or less than 23 if equipment uses pressure altitude information):

The pilot must make sure that RAIM function is available on the projected route and for the flight period in B-RNAV areas. An alarm is provided by GARMIN system in that case.

When 23 or more satellites are available:

The prediction of satellite position is valid for 7 days. Their predicted availability is ensured for 48 hours by EUROCONTROL.

When less than 23 satellites are available:

The predicted availability of RAIM shall be confirmed short before each flight.

GPS flight plan

In the active flight plan, addition of a STAR or an approach is always made at the end of the flight plan. In the scope of these additions, the pilot must pay attention not to duplicate points.

Continue ▶

GPS navigation

2/2

▶ Continuing

Non precision approach with coupled autopilot

Coupling with autopilot may be made in NAV mode, except in the following cases:

- holding pattern,
- landing pattern turn,
- interrupted approach,

which have to be made in HDG mode.

For memory, the approach particular point name in the GARMIN system is as follows:

- IA = IAF
- FA = FAF ou FAP
- MA = MAP
- MH = MAHP

End of procedure.

5.1 - General

This section provides all of the required and additional performance data for airplane operations.

The section 9, Supplements of the POH, provides specific airplane performance associated with optional equipment and systems.

Section 5 Performance EASA Approved

5.2 - Noise level

	Maximum noise level permitted	Demonstrated noise level
FAR PART 36, Appendix G - Amdt 28	88 dB(A)	76.4 dB(A)
ICAO, Annex 16, Vol. 1, 6th edition, Amdt 8 Chapter 10, Appendix 6	85 dB(A)	76.4 dB(A)

Approved noise levels for TBM airplane are stated in EASA.A.010 Type Certificate Data Sheet.

• NOTE •

No determination has been made by the Federal Aviation Administration that the noise levels of this airplane are or should be acceptable or unacceptable for operation at, into or out of any airport.

Section 5 Performance EASA Approved

5.3 - Airspeed calibration

• NOTE •

Indicated airspeeds (IAS): instrument error supposed to be null (power configuration for cruise condition flight).

Example: Angle between wind direction and flight path : 50 ° Headwind : 8 kts Crosswind : 10 kts Wind speed : 13 kts

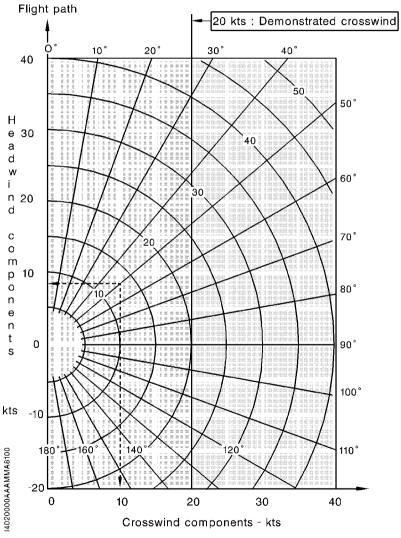

Figure 5.7.1 - Wind components

5.8 - Engine operation

The following tables or/and the optimum torque indicator must be used during normal operation of the airplane.

▲ CAUTION ▲

It is the responsibility of the operator to make sure that the required version of GARMIN system software is installed prior to using the hereafter engine operation tables.

The GARMIN system software required for this revision of the engine operation tables is the version 0719.14 or later.

This information is displayed on the MFD power-up page upon system start.

▲ CAUTION ▲

The TRQ setting must never exceed 100 %. When setting TRQ, Ng must never exceed 104 %.

The following conditions are given for all the tables (pages 5.8.3 to 5.8.10):

• NOTE •

Inertial separator must be OFF and BLEED HI msg OFF.

•

- Landing gear and flaps UP.
- BLEED switch on AUTO.
- represent the ISA conditions at the flight level.

The torque must be set at or below the value corresponding to the local conditions of flight level and temperature.

• NOTE •

The engine ITT limit at 840°C during continuous operation may be used in case of operational need.

Example, for conditions:

- FL = 260
- $OAT = -22^{\circ}C$

the following tables give the maximum torque to be set.

Maximum climb power

TRQ setting = 83 % for IAS = 124 KIAS (Add 0.5 % of TRQ for each additional 10 KIAS on climb airspeed), cf. tables figures 5.8.1 and 5.8.1A

Maximum cruise power

TRQ setting = 97 %, cf. tables figures 5.8.3 and 5.8.3A

Recommended cruise power

TRQ setting = 92 %, cf. tables figures 5.8.4 and 5.8.4A

Maximum climb power (FL < 200) - 124 KIAS

Conditions: If BLEED HI msg ON, reduce TRQ by 5 %

• NOTE • : Add 0.5 % of TRQ for each additional 10 KIAS on climb airspeed.

Table not valid if **INERT SEP ON** and/or BLEED HI msg ON.

Figure 5.8.4A - Normal (recommended) cruise power (FL > 200)

• NOTE •

Refer to page 5.8.1 for general conditions

5.9 - Takeoff distances

The following tables give the takeoff distances for several weight configurations.

All common information applicable to tables (pages 5.9.2 to 5.9.4) are listed below.

Associated conditions ·

- Landing gear DN and flaps TO
- TRQ = 100 %
- BLEED switch on AUTO
- Hard, dry and level runway

In table headings:

- GR = Ground roll (in ft)
- D₅₀ = Takeoff distance (clear to 50 ft) (in ft)

NOTE •

Between ISA + 30°C and ISA + 37°C, it may be necessary to cut-off the BLEED in order to set TRQ = 100 % during takeoff while respecting the engine limitations. In this case, reduce power after takeoff to set the BLEED switch to AUTO.

In SL ISA conditions, nominal Np is of 1985 RPM.

Corrections:

- In case of wind, apply the following corrections:
 - Reduce total distances by 10 % every 10 kts of headwind
 - Increase total distances by 30 % every 10 kts of tail wind
- Other runway surfaces:

Takeoff distances given in the tables are for takeoff from hard, dry and level runway. Other runway surfaces require the following correction factors.

Increase distances by:

7 % on hard grass

10 % on short grass

15 % on wet runway

25 % on high grass

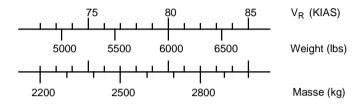

30 % on slippery runway

Weight: 5512 lbs (2500 kg)

Figure 5.11.7 - Cruise performance Maximum cruise / ISA + 10°C

Maximum cruise

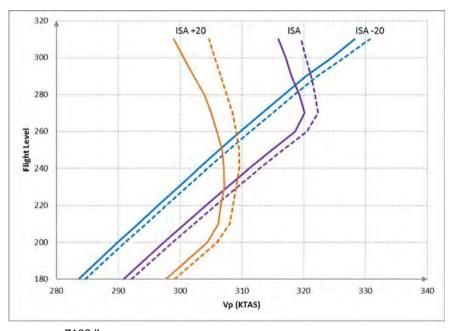

- ISA + 20°C
- Landing gear and flaps UP
- BLEED switch on AUTO and BLEED HI msg OFF
- NOTE : Use preferably recommended cruise power If BLEED HI msg ON :
 - Below FL 230: fuel flow will increase by 1 %, reduce the torque only to respect the maximum power of 100 %.
 - FL 230 and above : reduce the torque value mentioned in the table below by 3 %, leading to airspeed reduction by 4 KIAS.

Figure 5.11.15 - Cruise performance Normal cruise / ISA + 10°C

Normal cruise (Recommended)

- ISA + 20°C
- Landing gear and flaps UP
- BLEED switch on AUTO and BLEED HI msg OFF
- NOTE ●: Power recommended by PRATT & WHITNEY CANADA If BLEED HI msg ON:
 - Below FL 210: fuel flow will increase by 1 %, reduce the torque only to respect the maximum power of 100 %.
 - FL 210 and above : reduce the torque value mentioned in the table below by 4 %, leading to airspeed reduction by 4 KIAS.

5.14 - Landing distances

The following tables give the landing distances for several weight configurations.

All common information applicable to tables (pages 5.14.2 to 5.14.4) are listed below.

Associated conditions:

- Landing gear DN and flaps LDG
- Maximum breaking without reverse
- Hard, dry and level runway

In table headings:

- GR = Ground roll (in ft)
- D₅₀ = Landing distance (clear to 50 ft) (in ft)

Corrections:

- In case of wind, apply the following corrections:
 - Reduce total distances by 10 % every 10 kts of headwind
 - Increase total distances by 30 % every 10 kts of tail wind
- Other runway surfaces :

Landing distances given in the tables are for landing on hard, dry and level runway. Other runway surfaces require the following correction factors.

Increase distances by:

7 % on hard grass

10 % on short grass

15 % on wet runway

25 % on high grass

30 % on slippery runway

Weight: 7024 lbs (3186 kg)

Associated conditions:

- Approach speed IAS = 85 KIAS
- Touch-down speed IAS = 78 KIAS

Section 6 Weight and balance

Intentionally left blank

6.1 - General

This section is intended to provide the pilot with the procedure to determine the weight and balance of the airplane.

▲ WARNING ▲

It is the pilot's responsibility to ensure that the airplane is properly loaded and the weight and balance limits are adhered to.

This airplane allows multiple cabin seat configurations between 2 seats and 6 seats, as required by the operator - refer to chapter 7.3.

A list of equipment available for this airplane is referenced at the end of this POH refer to chapter 6.5.

The list of specific optional equipment installed on your airplane as delivered from the factory can be found in the records carried in the airplane.

Section 6 Weight and balance

Intentionally left blank

6.2 - Airplane weighing procedures

Refer to maintenance manual for the procedures to use.

• NOTE •

Weighing carried out at the factory takes into account all equipment installed on the airplane. The list of this equipment and the total weight is noted in the individual inspection record.

•

Section 6 Weight and balance

Intentionally left blank

6.3 - Baggage loading

There are two baggage compartments:

- one in fuselage non pressurized forward section, between firewall and cockpit with maximum baggage capacity of 110 lbs (50 kg),
- one located in the rear of the pressurized cabin with following characteristics :

>> With 6-seat configuration

- in the baggage compartment, behind the rear seats, with maximum loading capacity of 220 lbs (100 kg).
- stowing straps are provided for securing parcels and baggage on compartment floor. A partition net separating the cabin from the baggage compartment is attached to frame C14.

>> With other allowed seat accommodations

There are two loading areas:

- one in place of the 2 removed rear seats, with maximum loading capacity of 176 lbs (80 kg),
- one, in the baggage compartment, behind the rear seats area, with maximum loading capacity of 220 lbs (100 kg).

Two types of baggage securing nets can be used:

- the small cargo net is attached through nine anchoring points on seat rails, between frame C11 and frame C13bis - refer to section 2 for limitations, Figure 7.2.1B.
- the large cargo net is attached through seven anchoring points on seat rails, between frame C11 and frame C13bis and six anchoring points on fuselage sides, at frame C14 - refer to section 2 for limitations, Figure 7.2.1A.

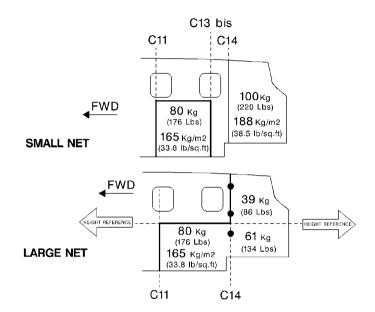

Figure 6.3.1 - Baggage limits

Authorized anchoring points are identified with green self-adhesive labels affixed to the inside of the rail.

A placard indicates loading limits for each securing net.

Evenly distribute the load within the cargo zone and ensure that overall weight is centered.

When using the large net, distribute the weight in each zone, delineated by the step in the floor, according to the zone limits.

>> All

▲ WARNING ▲

It is the pilot's responsibility to check that all parcels and baggages are properly secured in the cabin.

Transport of dangerous product is normally prohibited, however if transport of such product is necessary, it must be performed in compliance with regulations concerning transport of dangerous product and any other applicable regulation.

Baggage compartments loading must be done in accordance with the weight and balance limits of the airplane - refer to section 2 for limitations.

Generally, if rear seats are not used or are removed, first load AFT compartment, then, if required, FWD compartment. If rear seats are used, first load FWD compartment, then, if required, AFT compartment.

Compute and check the weight and balance diagram to ensure the airplane is within the allowable limits.

Section 6 Weight and balance

Intentionally left blank

6.4 - Determining weight and balance

General

This section is intended to provide the pilot with the procedure to determine the weight and balance of the airplane.

▲ WARNING ▲

It is the pilot's responsibility to ensure that the airplane is properly loaded and that the weight and balance limits are adhered to.

The procedure requires the following data related to the basic characteristics of the empty airplane to be obtained from the last airplane weight and balance report:

- the empty weight, expressed in kg or lbs,
- the moment, expressed in m.kg or in.lbs,
- the CG, expressed in MAC %

If the airplane empty weight has varied since last weight and balance report (for example, due to installation of optional equipment), refer to paragraph Determining empty airplane characteristics to determine new empty weight and the corresponding moment.

Utilization of weight and balance graph

This procedure determines the airplane weight and balance characteristics for flight.

Select the units for the weight and balance determination, either m and kg, or lb and in, and use the dedicated form - see figures 6.4.3 or 6.4.4, appropriate to the chosen units.

- 1) Record the basic empty weight (1a), moment (1b) and CG (MAC %) (1c) from the last weight and balance report see sample of weight and balance report, figures 6.4.1 and 6.4.2.
- 2) Record the expected loading (2a) and compute each associated moment (2b).
- 3) Compute zero fuel weight (3a) and moment (3b) as sum of all the above weights (1a)+(2a) and moments (1b) + (2b).
- 4) Check value (3a) to be below maximum zero fuel weight.
- 5) Compute zero fuel weight arm (5) and CG (MAC %) (5c) using given formulas.
- 6) Record the loaded fuel (6a) and compute associated moment (6b).

- 7) Compute ramp weight (7a) and moment (7b) as sum of zero fuel weight (3a) + loaded fuel (6a) and moments (3b) + (6b).
- 8) Check value (7a) to be below maximum ramp weight.
- 9) Compute ramp weight arm (9) and CG (MAC %) (9c) using given formulas.
- Record the expected taxi fuel (negative value) (10a) and compute associated moment (10b).
- 11) Compute takeoff weight (11a) and moment (11b) as sum of ramp weight (7a) + taxi fuel (10a) and moments (7b) + (10b).
- 12) Check value (11a) to be below maximum takeoff weight.
- 13) Compute takeoff weight arm (13) and CG (MAC %) (13c) using given formulas.
- 14) Record the expected trip fuel (negative value) (14a) and compute associated moment (14b).
- 15) Compute landing weight (15a) and moment (15b) as sum of takeoff weight (11a) + trip fuel (14a) and moments (11b) + (14b).
- 16) Check value (15a) to be below maximum landing weight.
- 17) Compute landing weight arm (17) and CG (MAC %) (17c) using given formulas.
- 18) Plot zero fuel weight, takeoff weight and landing weight on weight and balance diagram.
- 19) Check that all points are within the weight and balance limits and check that they are vertically aligned.
- 20) Record these data on your navigation log.

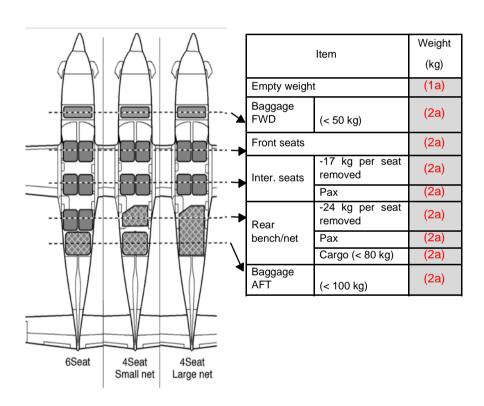

Airplane loading form (m, kg)

Determining empty airplane characteristics

Empty airplane characteristics (weight and balance) may vary with regard to those indicated on weighing form according to installed optional equipment and installed seats.

List of equipment (refer to chapter 6.5) contains the standard and optional equipment, as well as their characteristics (weight, arm), except those listed in this Chapter.

Use the chart below to compute new empty weight and corresponding balance if necessary.

Date	Equipment or modification description	(+) (-)	Weight modification		Basic empty weight			
			Weight Ib	Arm in.	Moment lb.in/1000	Weight W	Arm "d _o "	Moment
	According to delivery							

Figure 6.4.7 - Sample weight and balance record

CG m.a.c.% =
$$\frac{\text{(do} - 172.93)}{59.45} \times 100$$

Use the above formula to express arm $\mbox{"d}_{\mbox{\scriptsize 0}}\mbox{" in }\%$ of mean aerodynamic chord.

• NOTE •

Arm expressed in inches with regard to reference.

•

FWD baggage compartment: 128.0 in. (3.250 m)

Baggage compartment in pressurized cabin: 303.0 in. (7.695 m)

Fuel: 189.8 in. (4.820 m)

7.1 - General

This section provides description and operation of the airplane and its systems.

Some of the equipment described herein is optional and may not be installed in the airplane.

Complete description and operation of the GARMIN integrated flight deck are detailed in the GARMIN Integrated Flight Deck Cockpit Reference Guide. References to this guide are often made all along this section to get more details about some systems.

Details of other optional systems and equipment are presented in section 9 Supplements of the POH.

Intentionally left blank

7.2 - Airframe - see figures 7.2.1, 7.2.1A and 7.2.1B

This airplane is a six-place, low wing airplane.

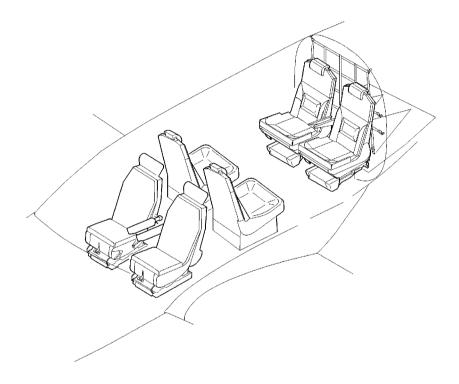

The airplane can be changed into 2, 3, 4 or 5-seat accommodation.

The structure is a semi-monocoque all-metal construction and is equipped with a retractable tricycle landing gear.

The pressurized cabin is equipped, on the left side of fuselage, with a one-piece access door and folding stairs comprising a hand rail allowing pilot and passengers boarding. The occupants have access to cockpit and to rear seats through a central aisle.

An optional pilot door located forward of the cabin on the left side allows access to the cockpit by means of folding stairs.

The aft cabin section is a baggage compartment.

14251201AAAKMA8000

Figure 7.2.1 - Cabin arrangement 6-seat accommodation

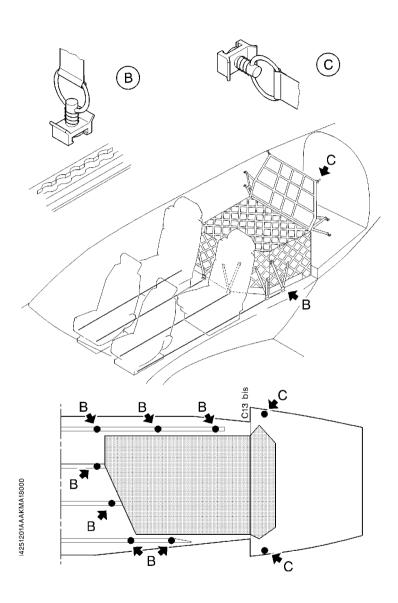

Figure 7.2.1A - Cabin arrangement 4-seat accommodation with large securing net

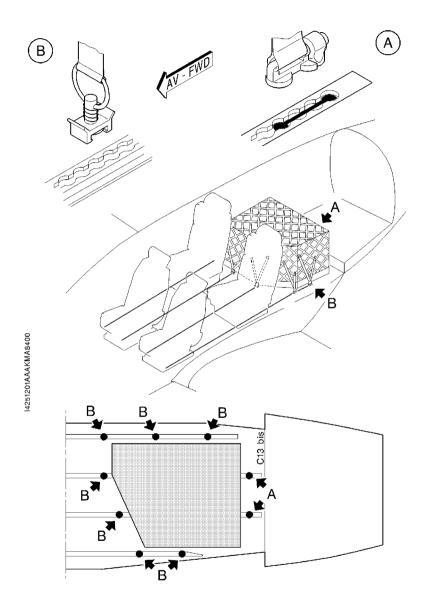

Figure 7.2.1B - Cabin arrangement 4-seat accommodation with small securing net

Wings

The wings are monocoque, bi-spar structures. Main spars of each wing are linked to the fuselage by two integral attach fittings. Each wing contains a main landing gear well and sealed casings forming the fuel tank. The wing leading edge is equipped with a deicing system.

Each wing extremity is equipped with a winglet.

Ailerons, spoilers and pitch trim tab

The ailerons located on external trailing edge of each wing are hinged on two attach fittings fixed on the rear spar. They allow airplane lateral control and are controlled mechanically through control wheel rotation.

The spoilers located in front of flaps, on top skin side, are mechanically linked to the ailerons.

Trim tab attached on the trailing edge of L.H. aileron is electrically activated by a trim knob, through an actuator.

Wing flaps - see figure 7.2.2

The wing flaps are large span slotted flaps with a single rotation point. They are activated by actuating rod-controlled screw jacks linked to an electric motor located under the floor, inside the fuselage.

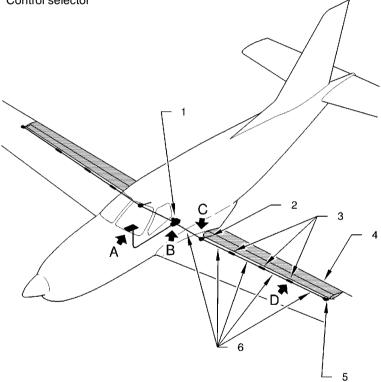

A preselection control located on the right side of pedestal console allows the pilot to select one of the three positions (UP - TO - LDG). For each control position, a deflection angle is defined (0°, 10°, 34°).

A monitoring device interrupts flaps movement as soon as a deflection dissymmetry is detected.

Empennages

Empennages are composite structures. The horizontal empennage consists of a horizontal stabilizer (PHF), control surfaces and elevator trim tabs; the vertical empennage consists of a vertical stabilizer, the rudder and the rudder trim tab. The empennage leading edge is equipped with a deicing system.

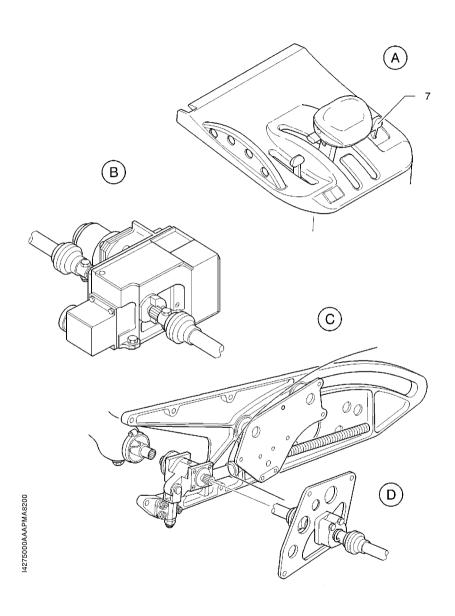

Figure 7.2.2 (2/2) - Wing flaps

Intentionally left blank

7.3 - Accomodations

Instrument panel

The instrument panel contains instruments and controls necessary for flight monitoring. The typical instrument panel consists of all standard equipment, as well as additional optional equipment.

Upper panel - see figure 7.3.2

The upper panel located at the top part of the windshield, contains electrical generation control panels, engine starting, ancillary electrical systems, AP/TRIMS switch, ELT remote control switch and the fuel control panel.

Rearwards of upper panel, the central part of cockpit overhead panel provides loud-speakers, a warning buzzer and cockpit floodlights.

Instrument panel - see figure 7.3.1

The instrument panel consists of the integrated flight deck composed of three screens [two primary flight displays (PFD) and one multi-function display (MFD)] - refer to the GARMIN cockpit reference guide for detailed description. Apart from the GARMIN flight deck system, equipment listed below complete the instrument panel.

- Left area instrument panel includes see figure 7.3.3 :
 - . on top : ESI-2000, MASTER CAUTION and MASTER WARNING,
 - . at bottom : deicing controls and indicators, MICRO/MASK switch, landing gear control panel, parking brake control and left station control wheel.
- Central area instrument panel includes see figure 7.3.4 :
 - on top: surmounted by the stand-by compass, AFCS control unit,
- >> Before ECS AUTO mode removal (Pre-MOD70-0529-21)
 - . at bottom: MFD control unit and ECS control panel.
- >> After ECS AUTO mode removal (Post-MOD70-0529-21)
 - . at bottom: MFD control unit and A/C and PRESSURIZATION panel.

>> All

Right area instrument panel includes - see figure 7.3.5 :

. on top : locations for optional equipment,

. at bottom : alternate static source selector, hour meter and the right

station control wheel.

- Emergency air control is located under the right area instrument panel.

An hourmeter is located on the right side of instrument panel.

An adjustable air outlet is located on both sides of instrument panel lower part.

Reception-micro jacks are located inside the recess under the arm-rest on both lateral sides of the cockpit, on R.H. side of intermediate R.H. passenger's seat and on the arm-rest of rear R.H. passenger's seat.

Pedestal console - see figure 7.3.6

The pedestal console, under the MFD control unit, comprises flaps controls, pitch trim tab control wheel, aileron trim switch, engine controls and fuel tank selector.

Circuit breakers panel - see figures 7.3.7 and 7.8.4

Circuit breakers for all electrical equipment supplied by bus bars are located on a separate panel installed on the right side of cockpit.

>> Without v15 GARMIN software and voice alerts (Pre-MOD70-0407-00).

General alarms warning lights and CAS messages

WARNING and **CAUTION** messages appear on the MFD CAS window to alert crew about monitored systems discrepancies. As a message appears, a chime is heard. Refer to the GARMIN cockpit reference guide to know all possible CAS messages.

A **MASTER WARNING** red flashing indicator and a **MASTER CAUTION** amber indicator located on instrument panel - see figure 7.3.8, in front of the pilot, illuminate as soon as one or several messages of same color light on.

To cancel and reset a general alarm, press on the red or amber indicator. A pressure on the red indicator also stops red message associated aural tones.

Aural warnings - see figure 7.3.2

The aural warnings are intended to alert the pilot during some configurations. The aural signals are heard through the loud-speakers or the buzzer installed in cockpit overhead panel.

The aural warnings consist of:

- the aural warning box,
- the buzzer and loud-speakers.

The system uses:

- the stall warning horn,
- the VMO alarm,
- the landing gear control unit,
- the flap geared motor.

Aural warning box

The aural warning box consists of a box including logic circuits, which create the signals heard in the aural warning loud-speakers.

According to the airplane configuration, different signals are produced by the logic circuits:

- gear up and idle — high-pitched sound
- gear up and extended flaps — high-pitched sound
- stall — low-pitched sound

- gear up, idle and stall alternate high-pitched and low-pitched sounds
- gear up, extended flaps and stall alternate high-pitched and low-pitched sounds

The aural warning box is fixed under cabin floor, on L.H. side, between frames C5 and C6.

It is electrically supplied by ESS BUS 2 bar and protected by AURAL WARN circuit breaker.

Cockpit overhead panel - see figure 7.3.2

This panel includes following elements:

- the loud-speaker of GMA 1,
- the loud-speaker of GMA 2,
- the VMO alarm buzzer.
- the HORN TEST knob.
- the emergency lighting rheostat.

It is attached to the cabin upper part between frames C6 and C7.

The VMO alarm buzzer is electrically supplied by ESS BUS 2 bar and protected by AURAL WARN circuit breaker and the emergency lighting rheostat is electrically supplied by BATT BUS bar and protected by PANEL EMER circuit breaker.

Aural warning operation

The GMA 1 and GMA 2 audio control panels receive signals from the aural warning box. According to the airplane configuration, these signals are low-pitched and / or high-pitched.

The HORN TEST knob allows to test the correct operation of aural warnings :

- Set the SOURCE selector to BATT or to GPU.
- Push and hold the HORN TEST knob :
 - the VMO buzzer emits bips,
 - . the loud-speakers emit alternate low-pitched and high-pitched sounds.
- Release the knob to stop the alarms.

>> With v15 GARMIN software and voice alerts (Post-MOD70-0407-00)

General alarms warning lights and CAS messages

warning and caution messages appear on the MFD CAS window to alert crew about monitored systems discrepancies. As a message appears, a chime is heard. Refer to the GARMIN cockpit reference guide to know all possible CAS messages.

A **MASTER WARNING** red flashing indicator and a **MASTER CAUTION** amber indicator located on instrument panel - see figure 7.3.8, in front of the pilot, illuminate as soon as one or several messages of same color light on.

To cancel and reset a general alarm, press on the red or amber indicator. A pressure on the red indicator also stops red message associated chimes.

Aural warnings - see figure 7.3.2

The aural warnings are intended to alert the pilot during some configurations. The aural signals are heard through the loud-speakers installed in cockpit overhead panel and through the pilot's and R.H. station headsets.

The aural warnings consist of:

- the GARMIN flight deck system (GIA and GMA),
- the loud-speakers.

The system uses:

- the stall warning system,
- the airspeed indicator,
- the landing gear control unit,
- the flap geared motor,
- the idle position sensor.

Aural warning alerts

According to the airplane configuration, different aural warning alerts sound:

gear up and idle
 gear up and extended flaps
 stall
 gear up, idle and stall
 gear up, extended flaps and stall
 IAS > 269 ± 3 KIAS
 landing gear / landing gear
 stall / landing gear
 overspeed / overspeed

Refer to the GARMIN cockpit reference guide for description of the other aural warning alerts.

>> With HORN TEST push-button (Pre-MOD70-0463-92)

Cockpit overhead panel - see figure 7.3.2

This panel includes following elements:

- the loud-speaker of GMA 1,
- the loud-speaker of GMA 2,
- the HORN TEST push-button,
- the emergency lighting rheostat.

It is attached to the cabin upper part between frames C6 and C7.

The emergency lighting rheostat is electrically supplied by BATT BUS bar and protected by PANEL EMER circuit breaker.

The HORN TEST push-button allows to test the correct operation of aural warning:

- set SOURCE selector to BATT or GPU.
- push and hold the HORN TEST push-button: the loudspeaker emits stall / landing gear aural warning alert,
- release push-button to stop aural warning alert.
- >> With centralized TEST push-button (Post-MOD70-0463-92)

Cockpit overhead panel - see figure 7.3.2

This panel includes following elements:

- the loud-speaker of GMA 1,
- the loud-speaker of GMA 2,
- the TEST push-button,
- the emergency lighting rheostat.

It is attached to the cabin upper part between frames C6 and C7.

The emergency lighting rheostat is electrically supplied by BATT BUS bar and protected by PANEL EMER circuit breaker.

The TEST push-button allows to test:

- the autopilot control panel backlighting,
- the GMA panel (audio control panel) backlighting,
- the MASTER WARNING and MASTER CAUTION indicators,
- the deicing panel led,

- >> With stick shaker installation (Post-MOD70-0510-27)
- the stick shaker system,
- >> All
- the fire detection system, if installed,
- >> With angle of attack system (Post-MOD70-0423-34A)
- the stall aural warning alert.

Doors, windows and emergency exit

Cabin access door - see figure 7.3.9

The cabin one-piece access door, located on the left side of fuselage aft of the wings, opens outside. The retractable stairs and hand rail make boarding easier.

To open the door from outside the airplane (make sure the door is not locked), press on front end of the handle embedded in door (this pressure disengages the handle from its recess), then turn the handle upwards. Raise the door helping it to open. Two compensation actuators bring and maintain the door at its maximum opening position.

After door opening, tilt stairs downwards. Stairs down movement is damped by means of two gas struts and leads the hand rail to extend.

Retract stairs before closing access door and make sure door deflection area is clear.

To retract stairs, press on locking pin located on stairs front string board (see detail 1), raise retractable handle - see detail 2 and pull stairs inside cabin. While stairs are retracted, the hand rail folds up.

To close the door from inside the airplane, press on knob inside cabin forward of the door. The door driven by a geared motor tilts downwards up to a position near the complete closing. Pull the door until it aligns with fuselage and lock it by moving inside handle downwards. Check that all latch pins and hooks are correctly engaged (visible green marks).

DOOR lights on as long as cabin access door and pilot access door, if installed, are not correctly locked.

▲ CAUTION ▲

Before opening access door, make sure door deflection area is clear.

To open door from inside the cabin, unlock the handle by pressing on knob located on its left side, pull the handle toward inside and move it upwards. Open the door by pushing it upwards.

After door opening, tilt stairs downwards which leads the hand rail to extend.

▲ CAUTION ▲

To retract stairs from outside the airplane, raise stairs by pushing them upwards from the lower part and fold them inside cabin. While stairs are retracted, the hand rail folds up.

To close the door from outside the airplane, press on knob on outside fuselage at the right side of the door. The door driven by a geared motor tilts downwards up to a position near the complete closing. Push the door until it aligns with fuselage and lock it by moving outside handle downwards, then fold handle in its recess.

Check that all latch pins and hooks are correctly engaged, with green marks visible.

In case of geared motor failure, the door can be manually tilted downwards by pulling sufficiently to override action of compensating struts.

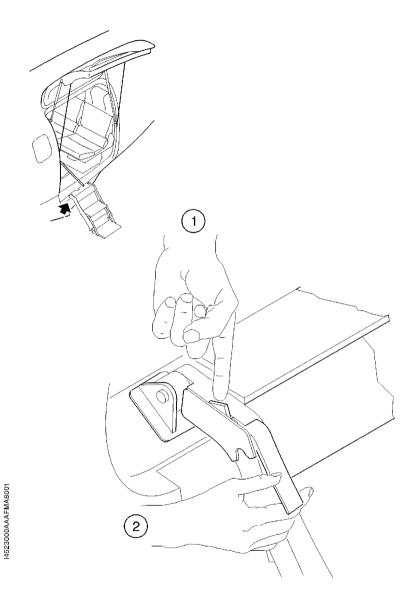

Figure 7.3.9 - Cabin access door

Cockpit access door - see figure 7.3.9A

The cockpit access door, so-called pilot door, if installed located on the left side of fuselage forward of the wings, opens outside. Retractable footstep makes boarding easier.

▲ WARNING ▲

As the pilot door is located in a dangerous area, wait for complete engine stop before operating this door.

To open the door from outside the airplane (make sure the door is not locked), press on front end of the handle embedded in door (this pressure disengages the handle from its recess), then turn the handle downwards. Pull the door helping it to open until it reaches its maximum opening position.

After door opening, tilt and unfold footstep.

Retract footstep before closing access door.

Fold and tilt footstep upwards.

To close the door from inside the airplane, pull the door until it aligns with fuselage and lock it by moving inside handle downwards. Check that each latch is correctly engaged in its recess, with green marks visible.

DOOR lights on as long as cabin access door and pilot access door, if installed, are not correctly locked.

To open door from inside the cockpit, unlock the handle by pressing on knob located on its right side, pull the handle inwards and move it upwards. Open the door helping it to open until it reaches its maximum opening position.

After door opening, tilt and unfold footstep.

Retract footstep before closing access door.

Fold and tilt footstep upwards.

To close the door from outside the airplane, push the door until it aligns with fuselage and lock it by moving outside handle upwards, then fold handle in its recess.

FWD compartment door

The FWD compartment door is located on the airplane left side between the firewall and the front pressure bulkhead. It is hinged at the top. It is maintained in the up position by a compensation rod. Two interlocking-type latches ensure its closing and it is equipped with a lock (same key as for the access door and the pilot door, if installed). When the door is closed, latches are flush with the fuselage profile.

FRONT CARGO DOOR lights on as long as FWD compartment door is not locked.

Windows

Windows do not open. The windshield consists of two parts electrically deiced.

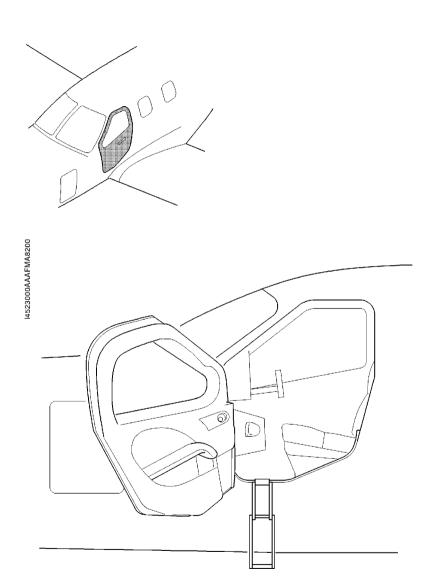

Figure 7.3.9A - Cockpit access door (pilot door)

Emergency exit - see figure 7.3.10

The emergency exit is installed on the right side of the fuselage and opens towards the inside. It is equipped with two handles, one inside and the other outside, each located on the upper frame.

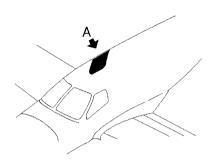

When the airplane is parked, the closing system may be locked by a safety pin provided with a flag marker. The handle is then inoperable.

▲ WARNING ▲

Taxiing and flying with thief-proof safety pin installed is forbidden.

To open the emergency exit, pull one of the two handles and tilt the emergency exit from top to bottom towards inside of airplane.

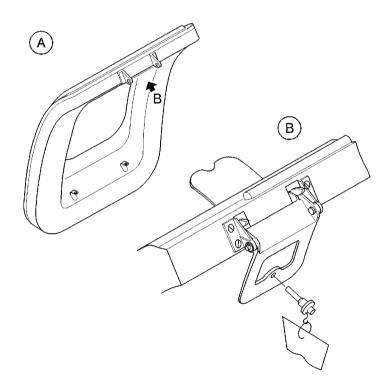

Figure 7.3.10 - Emergency exit

14522000AAAIMA8001

Seats, belts and harnesses

Cockpit seats - see figure 7.3.11

L.H. and R.H. front seats are mounted on rails attached to the structure. Longitudinal position, height and back-rest tilting of each seat can be adjusted and the arm-rest is hinged.

Pull up the handle located forward for longitudinal setting.

The seat height is adjusted by pulling up side forward handle while relieving the seat from the body weight.

The seat back angle is adjusted by pulling up side rearward handle.

Passenger seats - see figures 7.3.11 and 7.3.11A

>> With 6-seat accommodation

The accommodation consists of:

- two individual seats, installed back to the flight direction, mounted on the same rails as the front seats.
 - The seat back angle is adjusted by pulling up side handle.
- two rear seats arranged as a bench, mounted on the same rails as the front seats.
 - The seat back-rests tilt forward by pulling up the handle located forward on L.H. side of each seat which may tilt forwards by pulling up a rear handle to ease baggage loading in baggage compartment.
 - For longitudinal setting pull up the handle located forward, on R.H. side.

>> With 4-seat accommodation

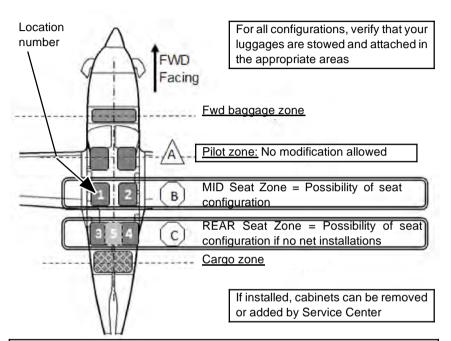

The accommodation consists of:

- two individual seats, installed facing flight direction, mounted on the same rails as the front seats.
 - The seat back angle is adjusted by pulling up side handle.

Many accommodations are possible. They are described hereafter

ONLY zone B and zone C can be modified for seat configurations

For the MID Seat zone B

ONLY the Middle Seats can be installed in MID Seat Zone.

This zone accepts Fwd and Aft Facing Mid Seat when rear seats are installed

The zone (B) accepts zero or 1 or 2 seats.

(The zone B) is not a luggage area).

Location number	FWD Facing	AFT Facing	Number of seat can be installed
1	YES	YES	1 or 0
2	YES	YES	1 or 0

For the REAR Seat zone ©

ONLY the Rear Seat can be installed in Rear Seat Zone.

The Zone C accepts zero or 1 or 2 seats.

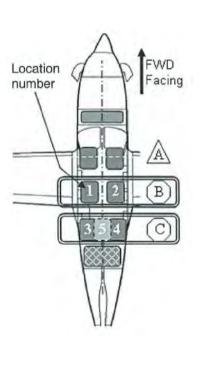

Location number	FWD Facing	Number of seat can be installed		
3	YES	1 or 0		
4 YES		1 or 0		
5 *(1)	YES *(1)	1 or 0 *(1)		

*(1) Centered on the fuselage axis

Here are all the configurations possibilities

Configuration	Location number				
name	1	2	3	4	5
C1	Χ	Χ	Χ	Χ	
C2	Χ	Χ			Χ
C3	Χ	Χ		Χ	
C4 ⁽¹⁾	Χ	Χ			
C5	Χ	Χ	Χ		
C6	Χ		Χ	Χ	
C7	Χ		Χ		
C8	Χ			Χ	
C9	Χ				Χ
C10 ⁽¹⁾	Χ				
C11		Χ	Χ	Χ	
C12		Χ			Χ
C13		Χ	Χ		
C14		Χ		Χ	
C15 ⁽¹⁾		Χ			
C16			Χ	Χ	
C17			Χ		
C18				Χ	
C19					Χ
C20 ⁽¹⁾					
	Zone (B)		Zone ©		<u>(C)</u>

(1) This configuration accepts small net or large net

Each cross indicates that you have a seat at the correspondent location number.

Belts and harnesses - see figure 7.3.12

▲ WARNING ▲

Incorrect closure of the safety belt may introduce a risk. Make sure it is tightened when buckled. To be most efficient, the belt must not be twisted. Check that there is no constraint when operated. After a serious accident, replace all belts.

Each cockpit seat is equipped with a four-point restraint system consisting of an adjustable lap belt and a dual-strap inertia reel-type shoulder harness.

Each passenger seat is equipped with a three-point restraint system consisting of an adjustable lap belt and an inertia reel-type shoulder harness.

Baggage compartments

>> With 6-seat accommodation

There are two baggage compartments:

- An AFT compartment located in the pressurized cabin between rear passenger seats and rear pressure bulkhead.
- A FWD compartment (non-pressurized) located between firewall and fwd pressure bulkhead.

The AFT compartment is accessible through the cabin by tilting forward the L.H. rear seat and / or L.H. or R.H. rear seat back-rests. Rings fitted with lashing straps are provided for securing parcels and baggage on compartment floor.

The FWD compartment is accessible by opening the external door located on the left side of the airplane.

These locations are designed for the carrying of low density loads; loading and unloading must be carried out with caution to avoid any damage to airplane.

The cabin is separated from the baggage compartment by a partition net intended to protect the passengers from injuries that could be caused by improper tie-down of a content.

The partition net is mounted at frame C14 - see figure 7.2.1, it is secured at the bottom to 4 points of the floor and on the sides to 6 points of the structure.

Maximum loads allowable in the baggage compartments depend on airplane equipment, refer to section 6 Weight and balance.

WARNING

Any parcel or baggage must be stowed by straps.

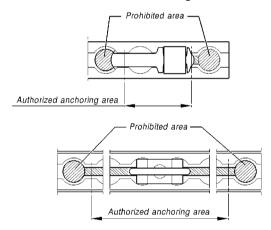

It is the pilot's responsibility to check that all the parcels and baggage are properly secured in the cabin.

In case of transport of dangerous materials, respect the law concerning transport of dangerous materials and any other applicable regulation.

>> With 4-seat accommodation

Two cargo nets are available for the pilot to safely secure and transport baggage:

 the small cargo net is attached through nine anchoring points on seat rails, between frame C11 and frame C13bis - see figure 7.2.1B.

 the large cargo net is attached through seven anchoring points on seat rails, between frame C11 and frame C13bis and six anchoring points on fuselage sides, at frame C14 - see figure 7.2.1A.

• NOTE •

Original partition net must be disconnected from side walls and placed on the floor.

4113500AAAAMA8000

4113500AAAAMA8100

Authorized anchoring points are identified with green self-adhesive labels affixed to the inside of the seat rail.

A placard indicates loading limits for each cargo net:

- for the small cargo net, it is affixed on frame C13bis,
- for the large cargo net, it is affixed on R.H. side upholstery panel, in the rear baggage compartment.

Maximum loads allowable in the baggage compartments depend on airplane equipment, refer to section 6 Weight and balance.

▲ WARNING ▲

Any parcel or baggage in cabin must be stowed by cargo net and straps.

It is the pilot's responsibility to check that all the parcels and baggage are properly secured.

In case of transport of dangerous materials, respect the law concerning transport of dangerous materials and any other applicable regulation.

Use of cargo nets

Net inspection

Before each use, visually inspect net for :

- webbing condition,
- seam condition of tensioning strap,
- metallic part condition.

Installation instructions

Tensioning straps must be installed so that they make a V with a minimum angle of 40° between both strands attached on the net. The net must be properly tight.

Damage acceptance criteria

If any damage is detected, such as:

- damage or absence of hook, buckle or stud on tensioning strap: strap must mandatorily be discarded and replaced,
- webbing frayed or cut on less than 30 % of its surface : reduce maximum load by 50 %,
- seam of vertical net tensioning straps damaged on less than 30 % of its length:
 reduce maximum load by 50 %,
- seam of tensioning straps attached on the rails damaged on less than 30 % of its length: reduce maximum load by 50 %,
- beyond 30% damage for above-mentioned cases, defective element must mandatorily be discarded and replaced,
- netting cut or torn on less than 3.9 in (100 mm): still serviceable, no impact,
- netting cut or torn on more than 3.9 in (100 mm) : do not carry small objects which dimensions are smaller than 4.9 x 4.9 x 4.9 in (125 x 125 mm).

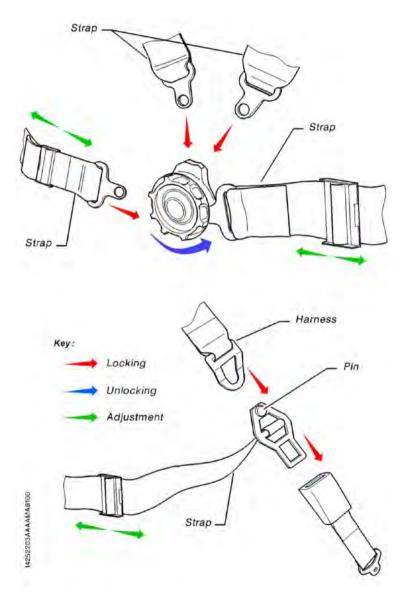

Figure 7.3.12 - Front and rear seat belts, with movable straps, and harnesses

7.4 - Flight controls

Flight controls consist of roll, pitch and rudder controls, as well as roll trim tab, pitch trim tab and rudder trim tab controls.

NOTE •

During airplane parking, it is recommended to lock flight controls - see figure 8.6.2

Roll - see figure 7.4.1

The roll control is activated by an assembly of rods and cables which links control wheels with the ailerons and the spoilers.

Aileron displacement is combined with that of spoilers, located at upper surface of each wing forward of flaps.

The spoiler rises from wing upper surface profile, when the aileron is deflected upwards and remains in wing profile, when the aileron is deflected downwards.

Control wheel movement is transmitted through rods to fuselage roll lever located under the floor. The movement is then transmitted through cables to the spoiler mechanism and from the spoiler mechanism to wing roll lever which activates the aileron through a rod.

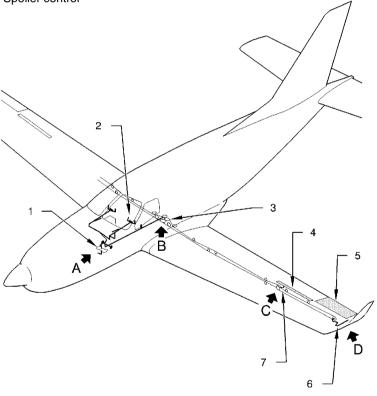

A rudder / roll combination spring-type system induces roll deflection at the time of pedals movement and vice versa.

Roll trim - see figure 7.4.2

The roll trim is controlled by a trim tab attached at trailing edge of the L.H. aileron. The trim tab is connected through two links to an electric actuator located in the aileron. A trim switch located on pedestal controls the roll trim tab maneuver.

Roll trim tab electrical circuit is protected by the AIL TRIM breaker.

- 6) Trim switch on pedestal console

14271000AAAYMA8003

Figure 7.4.2 (1/2) - Lateral trim

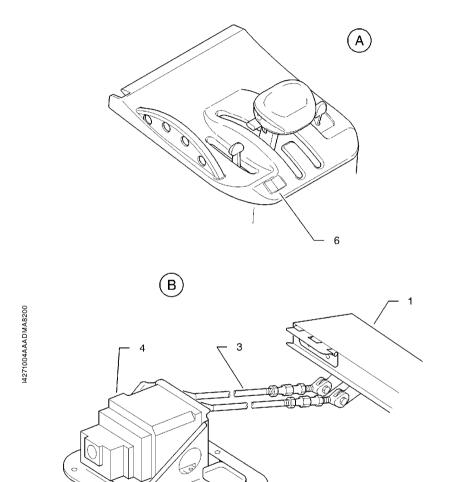

Figure 7.4.2 (2/2) - Lateral trim

Elevator - see figure 7.4.3

Both elevators are activated simultaneously by the same control. Each control surface is hinged at three points to the rear part of horizontal stabilizer.

The control wheel controls the two elevators through rods, bearings and bellcranks.

>> With stick shaker installation (Post-MOD70-0510-27)

A stick shaker is fixed on the pitch lever linked to the pilot control column lever. This is a mechanical device to vibrate the control wheel to warn the pilot in case of an imminent stall. When the data received from the AoA (angle of attack) sensor indicates an imminent stall, the AoA computer actuates both the stick shaker and the stall warning.

>> All

A spring actuator creates a nose-down artificial force which allows a better static stability.

Each control surface is provided with an automatic anti-tab (automaticity about 0.3), which is also used as trim tab.

Pitch trim - see figure 7.4.4

The pitch trim is accomplished through the two anti-tabs located on left and right elevators.

The trim tab can be controlled electrically or manually. It is activated through cables and a chain on two screw actuators attached to the horizontal empennage.

The electrical control consists of a switch (NOSE UP - NOSE DOWN) located on the pilot control wheel and a servo-motor attached under the pedestal.

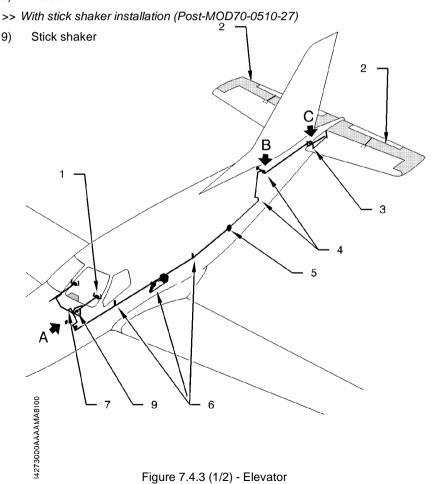

The electrical circuit for pitch trims is protected by the AP SERVOS breaker.

Manual control wheel is installed vertically on left side of pedestal console.

- 7) Electric pitch trim control

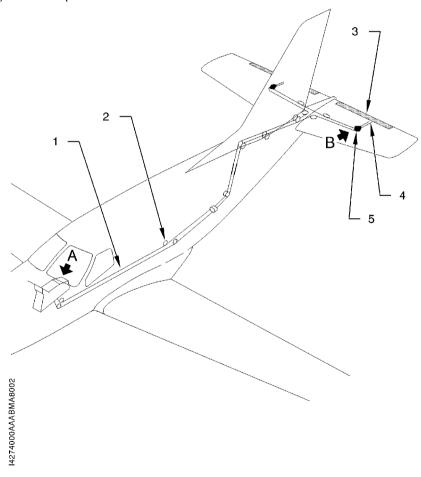

Figure 7.4.4 (1/2) - Pitch trim

Pilot's Operating Handbook

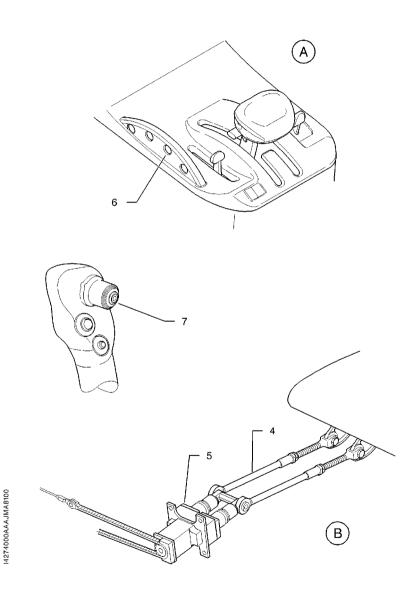

Figure 7.4.4 (2/2) - Pitch trim

Rudder - see figure 7.4.5

The rudder is hinged on three fittings attached to the vertical stabilizer rear spar.

The rudder pedals / rudder linkage is ensured through cables and a rod.

Pilot and R.H. station rudder pedal positions are adjustable at each station. The rudder pedal adjustment mechanism (for piloting comfort purposes) includes a manual control located against the external bulkhead beneath the instrument panel and a locking device on the rudder pedals. This ball locking device allows selecting six different positions.

When landing gear is down, rudder pedals are linked to nose gear steering system.

Spring system of rudder / roll combination induces aileron deflection at the time of pedal displacement and vice versa.

Rudder trim - see figure 7.4.6

A trim tab hinged at two points located at rudder trailing edge provides rudder trim.

Trim tab is linked by two rods to an electric actuator attached to rudder. It is controlled by rudder trim switch (Y L / Y R) located on pilot control wheel.

Electrical circuit of rudder trim tab is protected by RUD TRIM breaker.

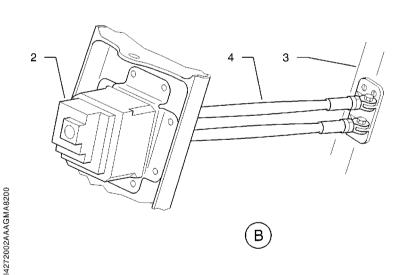

Figure 7.4.6 (2/2) - Rudder trim

Intentionally left blank

7.5 - Landing gear

The airplane is equipped with electro-hydraulically actuated, fully retractable tricycle landing gear.

Each landing gear is equipped with one wheel and an oil-air shock absorber integrated in the strut.

Main landing gears swivel on two ball joints installed on wing spars. Each landing gear retracts toward airplane centerline. The operation is accomplished by a hydraulic actuating cylinder which also provides up and down locking.

Nose gear swivels on two ball joints installed on a tubular steel mount frame. Its operation is accomplished by a hydraulic actuating cylinder which also provides up and down locking. The nose wheel is steerable. It is connected to pedals through a spring rod and is provided with a shimmy damper. In UP position, nose wheel is automatically disconnected.

Actuating cylinders have a locking device integrated at both ends. This device maintains landing gear in up or down position.

Landing gear doors, two on the nose gear, two on each main landing gear, are driven and kept in UP position by the landing gear itself.

All doors are mechanically kept in down position.

Hydraulic pressure

Hydraulic pressure required for landing gear operation is provided :

- during normal operation, by an electro-hydraulic generator with integrated reservoir.
- during emergency extension operation by a hand pump supplied with an auxiliary reservoir.

Landing gear lever - see figure 7.5.1

LANDING GEAR lever, located on LANDING GEAR panel at the bottom of instrument panel left part, is accomplished by an electric selector actuated through a lever ending with a knob representing a wheel. Operation is carried out by pulling on lever and by putting it in the desired UP (retracted) or DN (extended) position. This selector controls hydraulic generator.

Landing gear position indicator - see figure 7.5.1

Landing gear position indication is accomplished by 5 lights:

- On LANDING GEAR control panel
 - 3 green indicator lights (one per landing gear),
 - . 1 red warning light GEAR UNSAFE
 - . 1 amber light in the LANDING GEAR lever.
- On MFD CAS window :
 - **GEAR UNSAFE**

NOTE •

The amber light flashes while the hydraulic pump is operating to extend or retract the landing gear.

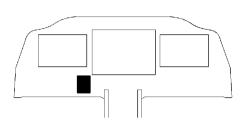

ullet

When landing gear is correctly retracted, all lights are OFF.

Down-locked correct indication is when there are 3 green indicator lights ON, the GEAR UNSAFE red warning light is OFF, the GEAR UNSAFE is OFF and the amber caution light is OFF. All other cases mean the gear is not down-locked.

In case of doubt about landing gear down-locked position, an independent electrical circuit provides a countercheck capability of the indication system. Pressing the CHECK DOWN push-button, located on the landing gear panel, checks the down-lock of the gear making twinkle, at 16 hertz, the green indicator lights corresponding to the down-locked gear.

Pressing the LIGHT TEST push-button allows testing all landing gear panel lights making them flash at 1 hertz.

- 1) Green indicator light
- 2) Red warning light
- 3) LANDING GEAR lever
- 4) CHECK DOWN push-button
- 5) LIGHT TEST push-button
- 6) Amber light

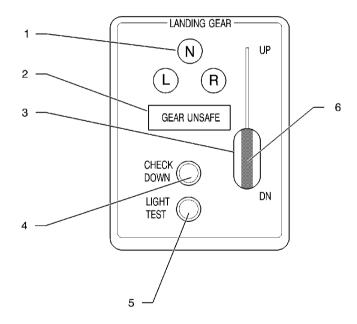

Figure 7.5.1 - Control panel and landing gear indicating

14326001AAAFMA8000

Safety

Safety switch - landing gear retraction

A safety switch installed on each main landing gear prevents, by detecting shock strut compression, landing gear accidental retraction when airplane is on ground.

>> Without voice alerts (Pre-MOD70-0407-00)

Landing gear horn

Landing gear horn is controlled by throttle and / or flaps. It emits continuous high-pitched sounds when :

- THROTTLE is on IDLE position and landing gear is not down-locked,
- flaps are beyond TO position (Takeoff) and landing gear is not down-locked.

NOTE •

If one of above conditions exists and airplane is in stall configuration, the audio-warning signal becomes alternated (high-pitched sound / low-pitched sound).

ullet

>> With voice alerts (Post-MOD70-0407-00) and without stick shaker installation (Pre-MOD70-0510-27)

Landing gear aural warning

Landing gear / Landing gear aural warning alert sounds when :

- THROTTLE is on IDLE position and landing gear is not down-locked,
- flaps are beyond TO position (Takeoff) and landing gear is not down-locked.

NOTE •

If one of above conditions exists and airplane is in stall configuration, the stall/landing gear aural warning alert sounds.

•

>> With voice alerts (Post-MOD70-0407-00) and with stick shaker installation (Post-MOD70-0510-27)

Landing gear aural warning

Landing gear / Landing gear aural warning alert sounds when:

- THROTTLE is on IDLE position and landing gear is not down-locked,
- flaps are beyond TO position (Takeoff) and landing gear is not down-locked.

• NOTF •

If one of above conditions exists and airplane is in stall configuration, the Stall/landing gear aural warning alert sounds and the control wheel vibrates.

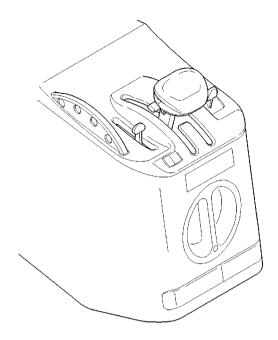

>> All

Emergency landing gear extension control - see figure 7.5.2

Emergency landing gear extension control consists of a hand pump and a by-pass selector.

This control is accessible by removing the floor panel located aft of the pedestal.

After bypass selector closing, hand pump operation sends hydraulic fluid directly into landing gear actuators; landing gear full extension and locking requires up to 110 cycles.

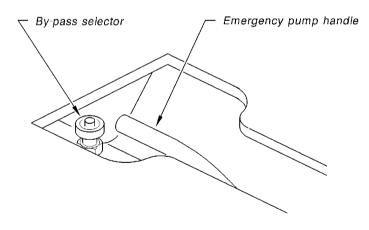

Figure 7.5.2 - Emergency landing gear extension control

14323500AAAQMA8100

Ground maneuvers

Nose gear steering control - see figures 7.5.3 and 7.5.4

Nose gear steering control is combined with rudder pedals and is fitted with a shimmy damper. When one of rudder pedals is fully pushed, nose wheel swivels about 20°. Steering may be increased up to 28° by applying differential braking to each side.

Airplane may be towed by attaching a steering or towing bar on nose gear, refer to chapter 8.6 for operation. In that case nose wheel steering angle is limited to $\pm 28^{\circ}$.

Minimum turn diameter

Minimum turn diameter, figure 7.5.4, is obtained by using nose gear steering and differential braking.

▲ CAUTION ▲

Since tight turns lead to untimely tire wear, turns should be made using the largest possible turning radius.

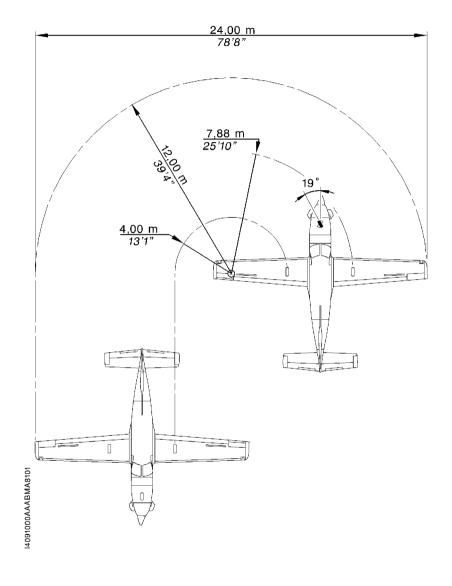

Figure 7.5.3 - Minimum turn diameter (Full rudder pedals travel without using differential braking)

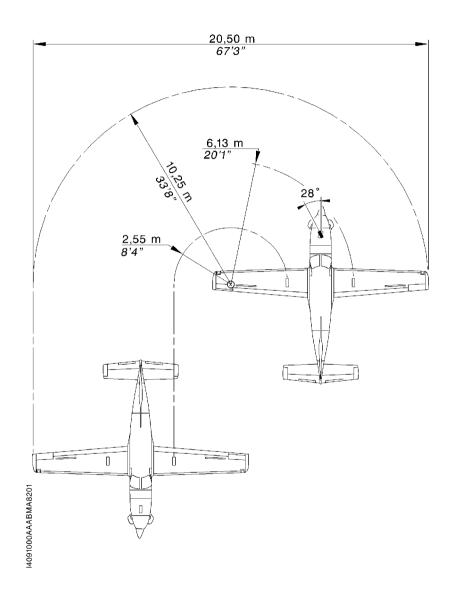

Figure 7.5.4 - Minimum turn diameter (Full rudder pedals travel by using differential braking)

Brake system - see figure 7.5.5

Airplane is equipped with a hydraulically actuated disc braking system installed on the main landing gear wheels.

Each toe brake at L.H. and R.H. stations is equipped with a master cylinder which sends hydraulic pressure to the corresponding disc brake: L.H. pedals L.H. brake; R.H. pedals R.H. brake. This differential braking helps maneuvering during taxiing.

Parking brake - see figures 7.5.5 and 7.5.6

Parking brake control consists of a control knob located on pilot's side lower instrument panel and a valve which regulates brake pressure.

To apply parking brake, press on toe brake of rudder pedals and position control knob on ON.

PARK BRAKE lights on when control knob is positioned on ON.

NOTF •

Operating the parking brake knob without applying pressure on rudder pedals does not cause the wheels to be braked.

•

To release the parking brake, turn the selector to the left in order to set the index upwards to OFF position and check at the same time that the PARK BRAKE disappears.

Intentionally left blank

7.6 - Powerplant

Turboprop engine operation - see figure 7.6.1

The PRATT & WHITNEY CANADA turboprop engine (PT6A-66D model) is a free turbine engine rated at 850 SHP and developing a thermodynamic power of 1825 ESHP.

Intake air enters engine through an annular casing and is then ducted toward compressor. The latter consists of four axial stages and one single centrifugal stage assembly to form a whole assembly. Compressed air and fuel are mixed and sprayed into combustion chamber by fuel nozzles. The mixture is first ignited by two spark igniter plugs, then combustion continues as a result of air-fuel mixture flow. Gases resulting from combustion expand through a series of turbines. The first one (gas generator turbine) drives compressor assembly and accessories, the two other ones (power turbines), independant from the first one, drive propeller shaft through a reduction gear box. Hot gases are evacuated through two exhaust stubs located laterally on both sides forward of engine cowling.

All engine driven accessories, except power turbine tachometer, propeller governor and overspeed governor are installed on accessory gearbox located rearward of engine.

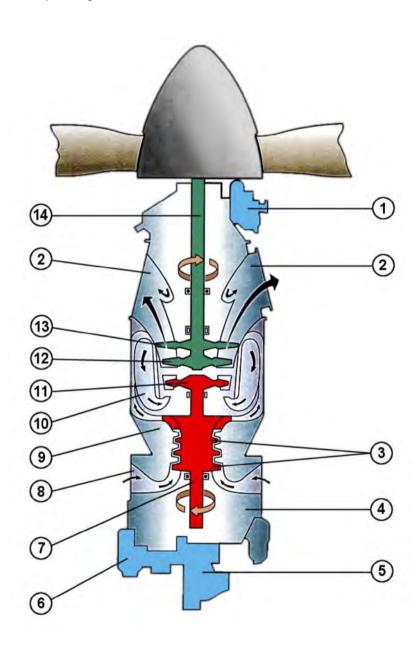

Figure 7.6.1 (2/2) - Powerplant

Engine control levers - see figure 7.6.2

Engine operation requires use of two levers located on pedestal console in cabin :

- THROTTLE (Item 1), and its detent for reverse (Item 4)
- MAN OVRD control for emergency fuel regulation (Item 3).

 $\bullet \ \mathsf{NOTE} \ \bullet$ Thumbwheel for lever friction (Item 2).

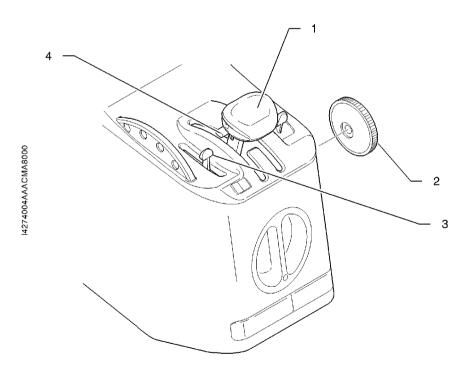

Figure 7.6.2 - Engine control levers

THROTTLE - see figure 7.6.3

The THROTTLE has two operating modes: thrust mode and condition mode.

Thrust mode

The THROTTLE is in vertical position. It modulates engine power from full reverse to max power.

Engine running, the throttle rearward displacement, past the lock using the detent, allows to control:

- the engine power in the Beta range from idle to maximum reverse,
- the Beta valve to select the propeller pitch in reverse.

Return to idle position is accomplished by pushing the THROTTLE forward.

▲ CAUTION ▲

Do not move the cockpit THROTTLE into the propeller reverse position or damage to the linkage will result.

Reverse may only be selected with engine running and propeller turning.

Any rearward effort on the THROTTLE, past the idle stop, may damage or break the flexible control cable.

When engine is shutdown, there is no oil pressure in the propeller and the feathering spring locks the Beta ring and the propeller reversing interconnect linkage on the engine.

Pilot's Operating Handbook

- Condition mode

The THROTTLE is moved to the condition side by lifting the knob.

As long as the THROTTLE is in condition mode, the propeller is in feather position. The THROTTLE can be positioned to CUT OFF, idle LO-IDLE or idle HI-IDLE.

Change from idle HI-IDLE to LO-IDLE position requires moving the THROTTLE rearwards.

Change from idle LO-IDLE to CUT OFF position is only possible after having overridden the idle gate. To override idle gate, raise the THROTTLE and move it rearwards.

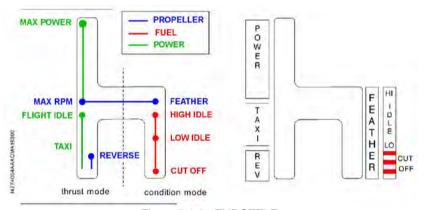

Figure 7.6.3 - THROTTLE

MAN OVRD control - see figure 7.6.2

MAN OVRD control (3) is normally notched in full backward position. In case of FCU or THROTTLE failure, it allows setting engine power manually.

To quit full backward position (notched), move the MAN OVRD control forward overriding the indexation.

NOTE •

The power available if the THROTTLE fails will be limited by the position of the lever.

Lever friction - see figure 7.6.2

A thumbwheel (Item 2) located on right side of pedestal console increases friction to avoid control slip of the THROTTLE after setting.

Engine instruments

Engine indicating consists of:

- engine torque expressed in percent (%), TRQ
- propeller speed in RPM, PROP RPM
- generator rotation speed expressed in percent (%), Ng
- ITT expressed in °C,
- oil pressure expressed in PSI.
- oil temperature expressed in °C.

NOTE •

Engine monitoring is ensured by $\ensuremath{\,^{\square}}$ and $\ensuremath{\,^{\square}}$ ITT and $\ensuremath{\,^{\square}}$.

Refer to the GARMIN Cockpit Reference Guide for further details.

Engine lubrication

Engine oil is in a tank incorporated into the powerplant. It ensures lubrication and engine cooling. A cooler located on left side in engine compartment maintains oil temperature within limits. Oil flow into the cooler is metered by a thermostatic valve. Engine oil also supplies propeller governor and engine torquemeter.

A chip detection system enables the monitoring of engine oil system. The system includes one chip detector installed on propeller reduction gear box and a second chip detector installed on engine accessory gear box. In case of chip detection, CHIP will appear on integrated flight deck system screen.

Lubrication system content, cooler included, is 12.7 quarts (12 litres). A graduated dipstick allows checking oil quantity in system. A visual oil sight glass, located on engine left side, allows a rapid checking of oil level.

NOTE •

For checking and oil filling-up, refer to section 8.

Engine starting - see figure 7.6.4

Ignition function

Ignition system consists of an ignition unit and two spark igniter plugs in powerplant, a three-position IGNITION switch OFF - AUTO - ON located on ENGINE START panel at upper panel.

Ignition unit supplies, from 28-volt source, high voltage current necessary to spark igniter plugs. When IGNITION switch is positioned to AUTO, ignition unit supply is ensured during the engine start.

IGNITION lights on as long as ignition unit is supplied.

Starter function

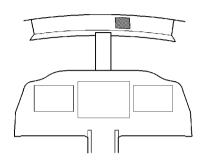

Starting system consists of STARTER switch located on ENGINE START panel, starter generator and ignition circuit (Refer to paragraph Ignition function).

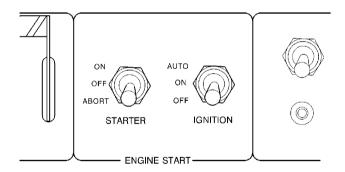

Starting procedure is semi-automatic. Setting STARTER switch to ON connects the starter generator which drives powerplant. **STARTER** lights on indicating that the starter generator is operating.

Starter operation is stopped automatically by the electrical power system once a sufficient starter-generator speed is reached or after 60 s. The pilot has the capability to interrupt the start process anytime by setting momentarily the STARTER switch to the ABORT position.

▲ WARNING ▲

Powerplant starting must be performed by qualified personnel and following procedures and parameters described in section 4 Normal procedures.

Engine air inlet

Engine air inlet is located at front lower section of engine cowling. Air inlet port is protected against icing by a hot air flux provided by engine. Air is driven throughout a duct in engine casing before entering engine through a protective screen. An inertial separator system inside the air duct protects the engine from ingesting dense particles (water, ice, fine gravels, sand).

Separator consists of two movable vanes. During normal operation, air is conducted directly towards engine air inlet. To separate particles suspended in the air, vanes are positioned to force engine induction air to execute a sharp turn: under the effect of centrifugal force denser particles separate from the air and are discharged overboard through two apertures located under engine cowling.

Operation of inertial separator vanes is electrically controlled by INERT SEP switch located on DE-ICE SYSTEM panel. When INERT SEP switch is set to ON, an electric actuator activates vanes; INERT SEP ON lights on when vanes have reached their maximum deflection and remains visible as long as switch remains ON. Full deflection takes about 30 seconds.

Exhaust system

Exhaust gases are evacuated through exhaust stubs located on sides of engine cowlings.

Engine accessories

All engine driven accessories, except power turbine tacho-generator (Np), propeller governor and overspeed governor, are installed on accessory gearbox located rearwards of engine.

Oil pump

Oil pump is a self-controlled gear pump located at the bottom of oil casing.

Fuel high pressure pump (HP)

Fuel high pressure pump is installed on accessory gearbox. It supplies fuel nozzles, flow being controlled by fuel regulator (FCU). Fuel provided by engine driven main pump (mechanical) enters high pressure pump through a filter, then it is discharged under pressure into fuel regulator (FCU) through a second filter. In case of contamination of this second filter, a by-pass valve allows fuel to go directly from high pressure pump to the regulator.

Compressor turbine tacho-generator (Ng)

Compressor turbine tacho-generator (Ng) is attached on accessory gearbox. It supplies a voltage which is transmitted to the GARMIN system for display on the MFD, under normal display conditions.

Power turbine tacho-generator (Np)

Power turbine tacho-generator is attached on the right side of the reduction gearbox. It supplies a voltage which is transmitted to the GARMIN system for display on the MFD, under normal display conditions.

Torque transmitter

Torque transmitter is attached on the torque limiter, it measures torque produced by the power turbine by comparing oil pressures (reduction gear and power turbine) and converts pressure difference into a voltage. This voltage is transmitted to the GARMIN system for display on the MFD, under normal display conditions.

Propeller overspeed limiter

Propeller overspeed limiter is installed on left side of the reduction gear box. It prevents a propeller overspeed in case of main propeller governor failure.

Propeller overspeed limiter is equipped with a solenoïd which makes feather the propeller when the THROTTLE is in condition mode.

Torque limiter

Torque limiter is located on right side of the reduction gear box. It is rated to limit engine torque to 109-110 % at sea level.

Propeller

Airplane is equipped with a composite five-bladed, constant-speed and full-feathering propeller.

Regulation

Propeller governor located on engine maintains rotation speed to the nominal value of 2000 RPM. Regulation is obtained through propeller blade pitch variation: counterweights drive propeller blades toward high pitch (low RPM) whereas oil pressure delivered by governor drives back blades toward low pitch (high RPM).

Propeller governor allows feathering either by voluntary pilot action via THROTTLE (Condition mode) or automatically in case of engine failure or shutdown.

Propeller reverse pitch allows reduced taxiing speed or landing roll. Change from idle to reverse position is performed with THROTTLE (Thrust mode) - refer to paragraph Engine controls.

7.7 - Fuel system - see figure 7.7.1

The fuel system comprises fuel tanks, fuel unit, selectors, manual and automatic, electric and mechanical boost pumps, engine fuel system, gaging installation, monitoring installation and drains.

Fuel tanks

Fuel tanks are formed by sealed casings in each wing. Each fuel tank comprises a filling port located at the end of wing upper surface, two drain valves located at the lower surface (one near main landing gear, at trailing edge side, the second one near wing root side, at leading edge), a vent valve located on the lower surface, a suction strainer and three level gages.

Fuel unit

The fuel unit combines shut-off valve, tank selector and filter functions. It is connected to the manual selector through a mechanical control. The fuel filter is located in a bowl at the lower part of the unit. It is fitted with a by-pass valve, a clogging indicator and a drain valve.

Tank manual selector - see figure 7.7.2

The FUEL TANK SELECTOR is located on the pedestal rear face. It allows selecting manually the tank (R or L) to be used and setting unit to OFF. To change from L position to OFF position, turn the selector clockwise (L \rightarrow R \rightarrow OFF); change from R position to OFF position requires a voluntary action from the pilot (pull and turn). The pull and turn maneuver prevents involuntary operation. When the unit is set to OFF,

FUEL OFF remains visible.

13)	Filter clogging indicator	26)	Sequencer

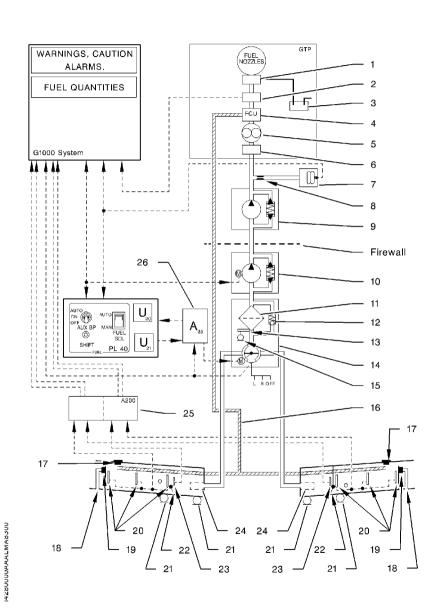

Figure 7.7.1 (2/2) - Fuel system

Automatic tank selector - see figures 7.7.2 and 7.7.3

Automatic tank selection allows, without pilot's intervention, feeding the engine from one tank or the other in predetermined sequences. These sequences depend on airplane configuration (ground, in-flight, fuel low level CAS messages appearance).

Automatic tank selection system comprises an electronic sequencer, an actuator attached on the fuel unit, FUEL SEL two-position selector (AUTO, MAN) and SHIFT push-knob located on FUEL panel.

To operate the automatic selector, set FUEL SEL switch to AUTO position and manual selector to R or L.

Selector operation

When the system is operated, AUTO SEL disappears; the sequencer chooses a tank (R or L) and through the actuator, positions the fuel unit selector on the selected tank. The sequencer controls the time during which the selected tank will operate. This time varies, depending on airplane conditions.

Airplane on ground: tank is changed every minute and 15 seconds.

Airplane in flight: tank is changed every five minutes, as long as **FUEL LOW L** or **FUEL LOW R** does not appear. When the first low level lights on, the sequencer immediately selects the other tank. The selected tank will operate until the second low level lights on. When **FUEL LOW L-R** is visible, the sequencer changes tanks every minute and 15 seconds.

NOTE •

The manual selector is driven by the fuel unit and is positioned on R or L mark corresponding to the tank selected by the sequencer. Therefore, the pilot continuously knows the tank which is operating.

Test for system proper operation

SHIFT push-button allows the pilot to test system proper operation anytime.

When the system operates, the fuel tank is changed when SHIFT push-button is pressed once.

If airplane is on ground or in flight, low level CAS messages not visible, the new selected tank remains operating and a new sequence is initiated.

NOTF

This procedure allows the pilot to preferably choose the tank from which he wants to take fuel.

•

In all cases, proper system operation is indicated by rotation of the manual selector.

Setting FUEL SEL switch to MAN position or setting FUEL TANK SELECTOR to OFF position leads to system de-activating and appearance of **AUTO SEL**.

AUTO SEL also lights on when order given by the sequencer has not been executed after 12 seconds.

Electric boost pump (AUX BP)

Electric boost pump is an auxiliary pump located between fuel unit and main mechanical boost pump. It is controlled through AUX BP switch located on FUEL panel. This switch allows stopping or selecting the two pump operating modes:

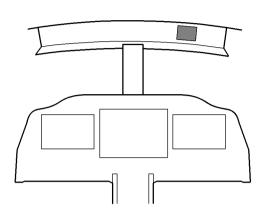

- when set to ON, electric boost pump operates permanently
- when set to AUTO, electric boost pump is automatically operated in case of fuel pressure drop at the mechanical boost pump outlet.

Figure 7.7.2 - Manual selector of fuel tanks

- 1) AUX BP switch
- 2) FUEL SEL switch
- 3) SHIFT push-button

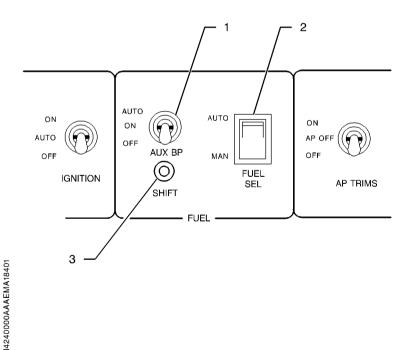

Figure 7.7.3 - Fuel control panel

Main mechanical boost pump

The mechanical boost pump is attached to accessory gearbox and supplies fuel necessary for engine operation.

Engine fuel system

The engine fuel system consists of a fuel regulator, pumps, filters, a fuel divider and fuel nozzles. The system provides the fuel flow necessary to satisfy the engine power and rating needs.

The fuel coming from airplane system goes through a heater which is automatically controlled by a thermostatic valve.

Fuel gaging installation

Fuel gaging installation is a capacitive type. Fuel data are displayed in us gallons. Three fuel level gages are installed in each tank. The wing root side fuel level gage is equipped with a low level detector which leads to fuel low level CAS messages appearance, when usable fuel quantity remaining in the concerned fuel tank is under about 9 USG (34 Litres).

Fuel system monitoring

Fuel system monitoring is ensured by CAS messages:

_	FUEL OFF	: Fuel tank selector set to OFF	=
-		. Fuel lank selector set to OFF	

- FUEL PRESS : Fuel pressure at mechanic pump outlet under

10 psi (± 2 psi)

- AUX BOOST PMP ON : Electric fuel pump running (manual or

automatic mode)

- FUEL LOW L-R * : Fuel quantity less than or equal to 9 USG

(34 Litres) of usable fuel in specified tank

AUTO SEL
 Sequencer inactive or operating defect

FUEL IMBALANCE : Fuel tanks imbalanced by more than 15 USG

(57 Litres) for more than 30 seconds

^{*} Only affected side (L, R or L-R) displayed in CAS message

Fuel system draining and clogging indicator - see figure 7.7.4

The fuel system comprises five drain points, a drain on the filter bowl, two drain valves on each tank, located on wing lower surface, one at wing root and the other past main landing gear well.

These drains allow draining water or sediments contained in fuel.

Fuel tank drain valves are provided with a slot which allows opening them with a screwdriver.

▲ CAUTION ▲

Fuel system draining shall be performed prior to the first flight of the day and after each tank refueling, using a sampler to pick off fuel at the two drain valves of each tank and at the filter vent valve.

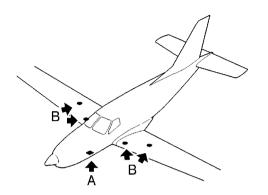

A red filter bypass flag on the fuel unit and visible from outside, when an inspection door located on L.H. side under front baggage compartment is open, indicates filter clogging. A push-button, adjacent to the inspection door, controls the illumination of a light provided to improve visibility of the clogging indicator. This indicator shall be observed during preflight inspection.

NOTE •

When filter gets clogged in flight, the filter is by-passed in order not to deprive powerplant from fuel. The powerplant is then supplied with non-filtered fuel.

- 2) Mirror door
- 3) Clogging indicator
- 4) Central access door
- 5) Filter drain
- 6) Tank drain
- 7) Drain bowl

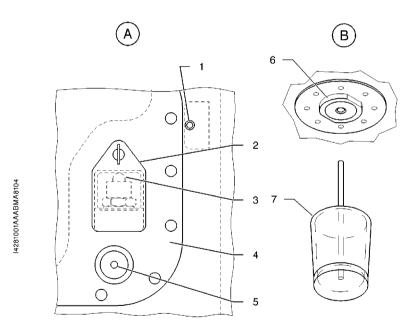

Figure 7.7.4 - Fuel system draining points and clogging indicator

7.8 - Electrical system - see figures 7.8.1, 7.8.2 and 7.8.5

The airplane is fitted with a 28-volt direct-current electrical system.

Electrical supply is obtained from various power supplies:

- a starter generator
- a stand-by generator
- a battery
- a ground power unit, via a plug, located on L.H. side.

Connection relays, main bus bar, generator regulation and protection systems and control logic systems are grouped in electrical power system box located in front baggage compartment upper section.

Electrical system indicating is displayed on the MFD and monitoring is ensured by CAS messages.

On ground, when the crash lever is positioned in the UP position (SOURCE selector in the OFF position), the battery supplies the electrical power system through the BATT BUS. A Power Up Built In Test (P-BIT) of the EPS internal functions is performed to verify the operating status. In case of failure detection, a white message EPS SERVICE REQUIRED appears in the message window on the PFD.

Starter generator

The starter generator is the main electrical power source. It only performs its generator function when starting sequence is completed.

Generator connection with main bus bar is controlled through GENERATOR selector set to MAIN position. It will be effective when connection conditions are met. Generator connection is indicated by MAIN GEN disappearance.

NOTE •

Starter generator will not supply airplane if source switch is on GPU. On ground, generator load should be maintained below 200 AMP.

Stand-by generator

Stand-by generator supplies a 28-volt stand-by direct current which may be used in case of main generator failure.

Generator connection with main bus bar is controlled through GENERATOR selector set to ST-BY, it will be effective when connection conditions are met.

NOTE •

Stand-by generator will not supply airplane if source switch is on GPU. In order to prevent possible errors during flight, access to ST-BY position requires a double action from the pilot (pull to unlock). On ground, avoid using stand-by generator at full load.

•

Battery

The battery provides the power required for starting when no ground power unit is available and is a power supply source when engine driven generators are stopped.

The battery is always connected to BATT BUS bus bar except when crash lever is pulled down.

Battery connection to main bus bar is controlled through SOURCE selector set to BATT position.

BAT OFF lights on when battery is isolated from the main bus and when main bus is supplied through another source.

Ground power receptacle

The ground power receptacle allows connection to a ground power unit.

Ground power receptacle connection with main bus bar is controlled through SOURCE selector when set to GPU position, it will be effective when connection conditions are met.

When SOURCE selector is set to GPU position, the battery and ground power unit are connected simultaneously on main bus bar.

Ground power receptacle door opening is indicated by **GPU DOOR** appearance.

NOTE •

Before connecting a GPU to the airplane, ensure that the voltage of the GPU is regulated between 27.5 volts and 28.5 volts.

The amperage output needs to be consistent with the airplane placard in front of compartment door: GPU shall provide a current limiting function, and current limit shall be set per placard.

Do not use batteries pack as GPU sources.

▲ CAUTION ▲

Use of a ground power source with voltage in excess of 28.5 volts or current exceeding current limit indicated on placard may damage the airplane electrical system.

Distribution

Airplane electrical systems are connected to bus bars and protected by pull-off type breakers located on R.H. side panel - see figure 7.8.4. In case of overload of a system, the breaker triggers and switches the system off.

▲ CAUTION ▲

If a breaker corresponding to a non essential system trips, do not reset in flight.

If a breaker corresponding to an essential system trips:

- allow it to cool for about three minutes, then the breaker may be reengaged (pressed down)
- if the breaker trips again, do not reset.

BUS 1, BUS 2, BUS 3 and BUS 4 bus bars are directly connected to main bus bar and protected by fuses located in electrical power system.

The ESS BUS 1 and ESS BUS 2 essential bus bars are connected to main bus bar through ESS BUS TIE switch set to NORM position. ESS BUS TIE switch is attached to breaker panel: NORM position is protected and locked by a cover. Common power supply to both essential bus bars is protected by a fuse, located in EPS box, and a breaker, located in the front cargo compartment on C2 frame right side, each bar being individually protected by a breaker.

BATT BUS bar is directly connected to the battery; it is protected by a fuse, located in EPS box, and a breaker, located in the front cargo compartment on C2 frame left side.

NOTE •

The electrical distribution of bus bars is described in figure 7.8.3.

•

Emergency use

With both generators de-activated in flight, it is still possible to use battery power to supply all airplane systems maintaining SOURCE selector on BATT position.

In order to save battery power, it is possible to shed the charges which are not essential for flight safety, for that set:

- ESS BUS TIE switch to EMER position

In this configuration, only ESS BUS 1, ESS BUS 2 and BATT BUS bars are supplied.

NOTE •

Supplying BUS 1, BUS 2, BUS 3 and BUS 4 bars is always possible, resetting temporarily ESS BUS TIE switch to NORM position.

•

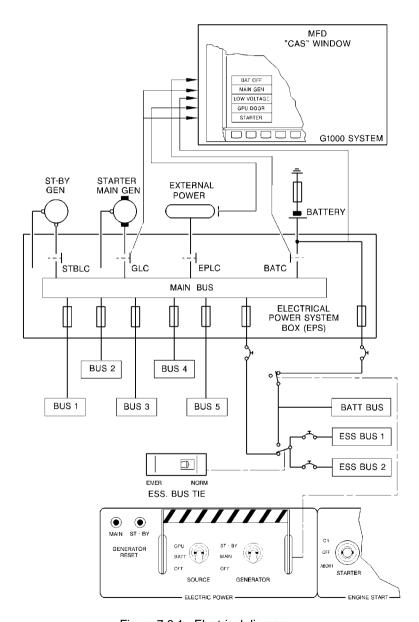

Figure 7.8.1 - Electrical diagram

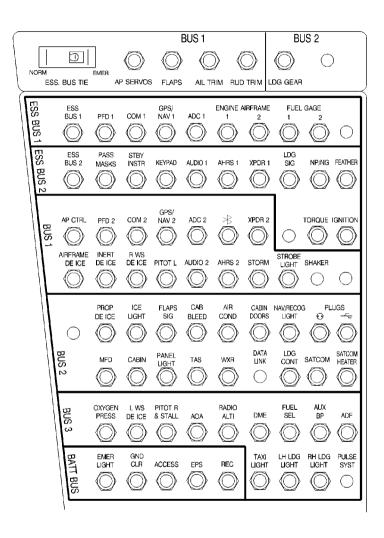

Figure 7.8.4A (4/4) - Breaker panel (Typical arrangement)

>> All

Indicating

Electrical system indicating consists of voltage and ampere indicating - refer to GARMIN cockpit reference guide for further details.

Following CAS messages may appear on the MFD CAS window:

BAT OFF : Battery is not connected to main bus bar

MAIN GEN : Starter generator is not connected to main bus bar

LOW VOLTAGE: Battery voltage is below the minimum value

GPU DOOR : Ground power receptacle access door is not closed

Protection - safety - see figures 7.8.2 and 7.8.5

The electrical power system provides systems protection in case of :

overvoltage

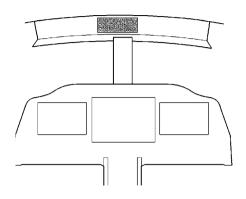

short-circuits

In case of disconnection of starter generator or stand-by generator following a failure, MAIN or ST-BY reset can be done by pressing corresponding GENERATOR RESET MAIN or ST-BY push-button.

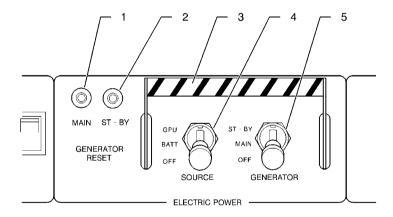

A battery reset is done by setting the SOURCE selector to OFF and back to BATT.

In case of disconnection of ground power unit following a failure, it is possible to re-activate the system by turning the SOURCE selector to OFF and setting it again to GPU position to reset the protection.

A crash lever located on upper panel center part allows isolating simultaneously BATT BUS bar and setting to OFF the SOURCE and GENERATOR selectors when lowered. In this case all bus bars are isolated from generators.

Figure 7.8.5 - Electrical control

Exterior lighting - see figure 7.8.6

The airplane is equipped with three strobe and navigation lights, two landing lights, two taxi lights, two recognition lights and a wing leading edge icing inspection light.

Landing lights

Landing lights are embedded in the winglets and located in leading edges. Lights illumination is controlled by setting to LDG, a switch located on upper panel.

The Pulse lite system, if installed, enables the pilot to control landing light flashing to be seen by the control tower or in heavy traffic areas.

Taxi lights

The taxi lights are embedded in the winglets and located in leading edges. They are controlled by setting to TAXI, a switch located on upper panel.

Navigation lights and strobe lights

Two strobe and navigation lights are installed in the winglets and one on the tail cone.

They are controlled by NAV and STROBE switches located on upper panel.

• NOTE •

By night, do not use anticollision lights in fog, clouds or mist as light beam reflexion may lead to dizziness and loss of sense of orientation.

Recognition lights

Recongnition lights are embedded in the winglets.

They are automatically switched on when the airplane is on ground.

Leading edge icing inspection light

The leading edge icing inspection light is installed on fuselage L.H. side, its beam illuminates the wing leading edge. It is controlled by the ICE LIGHT switch installed on DE ICE SYSTEM panel - see figure 7.13.1.

FWD compartment light

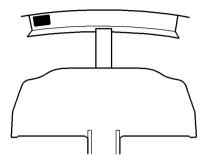

The dome light illumination of the FWD compartment is controlled by the switch located in the upper section of the door frame.

Fuel unit compartment light

The lighting of the fuel unit compartment allows improving the visibility of the clogging indicator by pressing the push-button located besides the inspection door.

Pilot's Operating Handbook

- 2) Pulselite system switch
- 3) Navigation lights switch
- 4) Strobe lights switch

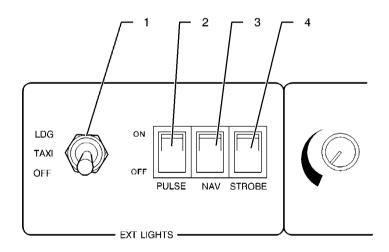

Figure 7.8.6 - External lighting controls

Interior lighting - see Figure 7.8.7

Interior lighting consists of access, cabin, instrument panel, instruments, baggage compartment and emergency lighting.

Access lighting

Access lighting consists of two floodlights located on the ceiling upholstering (one at the level of the access door, the other at the level of the storage cabinet) and the L.H. dome light of baggage compartment. ACCESS push-button on INT LIGHTS panel and the push-button located on access door rear frame control these 3 lights via a delayed breaker.

If the crash lever is down, access lighting is automatically cut out after 3 minutes. If the crash lever is up, there is no access lighting automatic cut out.

Cabin lighting

Cabin lighting consists of two swiveling floodlights for front seats, six individual floodlights for rear passenger seats and the baggage compartment R.H. dome light. Each floodlight is controlled by a push-button located near. The floodlight above the table is controlled by two switches which are two-way type switches. The pilot can switch off the cabin floodlights and the baggage compartment dome light with the CABIN switch.

Instrument panel lighting

Instrument panel lighting is controlled by the PANEL rheostat located on INT LIGHTS panel. This lighting consists of backlighted panels and a led lighting for the pedestal.

Breaker panel lighting

Breaker panel lighting is controlled by a switch located on the instrument panel near the pilot's control wheel.

Emergency lighting

Emergency lighting consists of two swiveling floodlights located on both sides of the cockpit overhead panel above front seats. It illuminates instrument panel assembly in case of visor lighting tubes and / or instrument integrated lighting failure.

A rheostat located on the cockpit overhead panel controls emergency lighting operation and intensity. Forward rotation of control knob allows changing from OFF position to minimum lighting then increasing lighting to maximum brightness.

- 1) Instrument panel lighting switch (rheostat)
- 2) DIMMER switch
- 3) Cabin lighting switch (rear seats reading light)
- Access door, baggage compartment and FWD dome light (delayed breaker) push-button
- 5) Emergency lighting switch
- 6) Breaker panel lighting switch

>> Before ECS AUTO mode removal (Pre-MOD70-0529-21)

7.9 - Air conditioning and pressurization

The airplane is equipped with a Global Air System (GAS), which ensures air conditioning and pressurization - see figure 7.9.1.

GAS controls are located on ECS panel at the L.H. side of the R.H. control wheel and above the arm rest of the L.H. side passenger's seat - see figure 7.9.2.

The system is monitored through CAS messages appearing on the MFD.

NOTE •

A list of abbreviations used in this chapter is given in figure 7.9.1.

•

The GAS is composed of 3 main sub-systems:

- engine bleed air system,
- dual zones environmental control system, including heating and cooling functions.
- cabin pressurization control system.

These 3 sub-systems are managed by a single digital controller (GASC), which receives information coming from:

- the sensors set in the sub-systems,
- the human interfaces set in the airplane.

The GASC elaborates the proper commands to the sub-system actuators and indication or warning elements.

Engine bleed air system

The engine bleed air system is designed to ensure the following functions:

- to bleed air from the engine,
- to ensure a controlled airflow in the cabin,
- to adjust the temperature of the bleed air at a compatible level, in order to control the cabin temperature in heating and cooling modes.

The BLEED switch allows to switch on the Engine Bleed Air System provided that the engine runs. The Ground Fan (GF) runs until takeoff, when BLEED switch is set to AUTO, and MAIN GEN is OFF.

The BLEED switch is fitted with a blocking device between AUTO and OFF/RST positions preventing the operator from a non expected setting of BLEED switch to OFF/RST position.

BLEED TEMP appears in the MFD CAS window (in display normal conditions), when the BLEED switch is set to AUTO and when the Bleed Temperature switch (BTSW) or the Overheat Thermal Switch (OTSW) triggers on.

BLEED OFF appears in the MFD CAS window (in display normal conditions), when the engine is running and the Flow Control Shut Off Valve (FCSOV) is closed.

To reactivate the system, set BLEED switch to OFF/RST, then to AUTO.

To bleed air from the engine

The engine bleed air system is based on 2 engine bleed ports operation. The normal operation is performed on P2.5 engine port as far as the pressure or temperature available at this port is able to comply with the needs. If one of these conditions is not fulfilled, the system automatically switches to P3 engine bleed port. The switching back to P2.5 supply is automatically performed as far as the conditions on P2.5 are restored to adapted values.

The sensor (IPPS) measures continuously the pressure at the P2.5 pressure port and sends the value to the Global Air System Controller (GASC) which manages the ports switching on condition with the Shut Off Valve (SOV). A Non Return Valve (NRV) secures the P2.5 pressure port when the P3 pressure port is opened.

To ensure a controlled airflow in the cabin

The bleed flow control operation, including bleed AUTO/bleed OFF/RST controls, is ensured by the FCSOV driven by the GASC.

To adjust the temperature of the bleed air

The bleed air outlet temperature control is ensured by the By-Pass Valve (BPV) in association with the Main Heat Exchanger (MHX).

The temperature measurement loop given by the Inlet Temperature Sensor (ITS) and the 2 Ventilated Temperature Sensors (CKVTS, CBVTS) send the value to the GASC which compares them with the set temperature and manages the BPV position. The BPV derives a part of the bleed air through the MHX to cool it and mix it to the remaining air.

The engine air bleed system is supplied by BUS 2 bar and protected by the CAB BLEED breaker.

Dual zones environmental control system

The environmental control system is based on two independent air circuits. The heating circuit uses the controlled temperature bleed air. The cooling circuit is based on a Vapor Cycle System (VCS).

The Environmental Control System is designed to ensure the following functions :

- Cockpit / cabin heating function
- Cockpit / cabin cooling function.

The environmental control system is supplied by BUS 2 bar and protected by the AIR COND breaker. Four fans are supplied by BUS 4 bar and protected respectively by following breakers: COND FAN, CABIN FAN, COCKPIT FAN and GND FAN.

The system includes an automatic load shedding feature which:

- shuts off the Ground Fan (GF) and the Condenser Fan COND FAN and opens compressor clutch when MAIN GEN is ON.
- shuts off all the Vapor Cycle System (VCS) during engine start.

Heating circuit

Hot air coming from the bleed air system is mixed with the cabin recirculating air in the Mixing Ejector (MIXEJ) in order to lower the blown air temperature. The resultant air flow enters the Hot Air Distributor (HAD) and is distributed in the cockpit / cabin zones regarding the demand.

It is dispatched:

- in the cockpit through ports located on pedestal sides, under each seat or through the demisting outlets.
- in the cabin through ports located on the lower section of the L.H. side and R.H. side cabin upholstery.

The HOT AIR FLOW distributor allows to select the windshield defog / cabin heating functions.

When the A/C switch is set to OFF position, the temperature is set by default by the GASC to 23°C.

Cooling circuit

There are two separate circuits: one for the cockpit and the other for the cabin.

In each circuit, air is sucked by means of a variable speed electrical fan, then it is blown through an evaporator and ducted to the different zones:

- cockpit circuit: by passing into the upper panel equipped with 2 swivelling and adjustable air outlets, through air outlets located on arm rests of pilot and R.H. side front passenger stations and through ports located under instrument panel,
- cabin circuit: by passing into the overhead duct equipped with 4 swivelling and adjustable air outlets and through ports located on the floor between the cabinets and the intermediate passenger's seats.

The VCS can be switched on, only if the fans are set at least to minimum speed. The compressor clutch and the condenser fan are controlled by the GASC.

In automatic mode, the temperature of each zone is controlled independently by the system according to the settings of the TEMP/°C and CABIN TEMP/°C selectors, which can vary from 17°C to 32°C. In this mode, the speed of each fan is automatically controlled.

In manual mode, the blown air temperature is controlled by the system according to the settings of each temperature selector. In this mode, the speed of each fan is set manually from Off to maximum speed position.

The A/C switch allows to switch on or off the Vapor Cycle System.

- If set to AUTO position :
 - on ECS panel, the TEMP/°C selector enables to select requested temperature of the cockpit zone,
 - above arm rest of L.H. side passenger's seat, the CABIN TEMP/°C selector enables to select requested temperature of the cabin zone.
- If set to MANUAL position :
 - on ECS panel, the TEMP/°C selector enables to select requested temperature and the FAN SPEED selector enables to choose blown air speed in the cockpit zone,
 - . above arm rest of L.H. side passenger's seat, the CABIN TEMP/°C selector enables to select requested temperature and the FAN SPEED selector enables to choose blown air speed in the cabin zone.

The CONTROL selector set to COCKPIT position inhibits the operation of the controls located in the cabin zone; only the cockpit controls settings are taken into account. If set to CABIN position, each zone controls its proper values.

Emergency air control (EMERGENCY RAM AIR control knob), located under R.H. side area instrument panel facing control wheel, enables outside air to enter the cabin through a valve. In NORMAL position, the valve is closed and the control is locked. To open emergency ventilation valve, press on locking knob and move control rearwards.

Cabin pressurization control system

The cabin altitude check is automatically ensured by the pressurization control system through a monitoring of the cabin pressure. The opening of the Outflow Valve (OFV) is controlled by the GASC through a torque motor fitted on the valve.

The Landing Field Elevation (LFE) entered by the pilot in the MFD is used by the GASC to manage the optimal cabin altitude rate of change in order to land with a cabin altitude equal to LFE minus 200 ft.

The Landing Field Elevation selection is done using:

- destination airport of the flight plan pressing SYSTEM and then FMS LFE on the MFD
- a manual entry pressing SYSTEM, then MAN LFE on the MFD.

The cabin altitude is automatically calculated by the GASC using the data sent by MFD.

In flight, the GASC controls the opening of the OFV in order to reach the automatic computed cabin altitude. The PRES MODE switch allows to select 2 pressurization modes:

- if set to AUTO, the GASC controls the cabin altitude rate of change in order to optimize comfort and avoid reaching maximum ΔP or negative ΔP
- if set to MAX DIFF, the cabin altitude is minimized throughout the flight. For airplane altitudes below 13500 ft, this results in cabin altitudes that could be as low as 0 ft. Above 13500 ft, the cabin altitude is minimized while maintaining $\Delta P < 6.0 PSI$.

The MFD shows landing field altitude, cabin climb speed in Sea Level ft/min and cabin-atmosphere differential pressure (ΔP) in PSI.

Cabin is automatically depressurized as soon as the airplane is on ground through landing gear switch (airplane on ground) or, if necessary, by actuating DUMP switch located on ECS panel (in normal operation, this switch is protected and locked by a cover).

Overpressure and negative relief safety are managed by both OFV and SFV. The safety functions are ensured by independent pneumatic modules fitted on both valves, which override the GASC control when necessary.

MAX DIFF MODE appears in the MFD CAS window, in display normal conditions, when the PRES MODE pressurization switch is set to MAX DIFF.

CABIN ALTITUDE appears in the MFD CAS window, in display normal conditions, when the cabin altitude is over 10000 ft.

CABIN DIFF PRESS appears in the MFD CAS window, in display normal conditions, when the cabin-atmosphere differential pressure is over 6.2 psi (427 mb).

The DUMP switch allows the pilot to open the OFV in order to de-pressurize the cabin. The OFV is fitted with a cabin altitude limitation device which overrides the DUMP function and forces the closure of the OFV if the cabin altitude reaches 14500 ft.

CPCS BACKUP MODE appears in the MFD CAS window when, due to malfunction, GASC cannot compute optimal cabin altitude.

In this case, cabin altitude is controlled by GASC to 9800 ft default value.

7.9 - Air conditioning and pressurization

The airplane is equipped with a Global Air System (GAS), which ensures air conditioning and pressurization - see figure 7.9.2A.

GAS controls are located on A/C and PRESSURIZATION panel at the L.H. side of the R.H. control wheel and above the arm rest of the L.H. side passenger's seat see figure 7.9.2A.

The system is monitored through CAS messages appearing on the MFD.

NOTE •

A list of abbreviations used in this chapter is given in figure 7.9.2A.

•

The GAS is composed of 3 main sub-systems:

- Engine bleed air system,
- Dual zones environmental control system, including heating and cooling functions,
- Cabin pressurization control system.

These 3 sub-systems are managed by a single digital controller (GASC), which receives information coming from:

- the sensors set in the sub-systems,
- the human interfaces set in the airplane.

The GASC elaborates the proper commands to the sub-system actuators and indication or warning elements.

Engine bleed air system

The engine bleed air system is designed to ensure the following functions :

- to bleed air from the engine,
- to ensure a controlled airflow in the cabin,
- to adjust the temperature of the bleed air at a compatible level, in order to control the cabin temperature in heating and cooling modes.

The BLEED switch allows to switch on the engine bleed air system provided that the engine runs. The Ground Fan (GF) runs until takeoff, when BLEED switch is set to AUTO, and MAIN GEN is OFF.

The BLEED switch is fitted with a blocking device between AUTO and OFF/RST positions preventing the operator from a non expected setting of BLEED switch to OFF/RST position.

BLEED TEMP appears in the MFD CAS window, in display normal conditions, when the BLEED switch is set to AUTO and when the Bleed Temperature switch (BTSW) or the Overheat Thermal Switch (OTSW) triggers on.

BLEED OFF appears in the MFD CAS window (in display normal conditions), when the engine is running and the Flow Control Shut Off Valve (FCSOV) is closed.

To reactivate the system, set BLEED switch to OFF/RST, then to AUTO.

To bleed air from the engine

The engine bleed air system is based on 2 engine bleed ports operation. The normal operation is performed on P2.5 engine port as far as the pressure or temperature available at this port is able to comply with the needs. If one of these conditions is not fulfilled, the system automatically switches to P3 engine bleed port. The switching back to P2.5 supply is automatically performed as far as the conditions on P2.5 are restored to adapted values.

The sensor (IPPS) measures continuously the pressure at the P2.5 pressure port and sends the value to the Global Air System Controller (GASC) which manages the ports switching on condition with the Shut Off Valve (SOV). A Non Return Valve (NRV) secures the P2.5 pressure port when the P3 pressure port is opened.

To ensure a controlled airflow in the cabin

The bleed flow control operation, including bleed AUTO/bleed OFF/RST controls, is ensured by the FCSOV driven by the GASC.

To adjust the temperature of the bleed air

The bleed air outlet temperature control is ensured by the By-Pass Valve (BPV) in association with the Main Heat Exchanger (MHX).

The temperature measurement loop given by the Inlet Temperature Sensor (ITS) and the 2 Ventilated Temperature Sensors (CKVTS, CBVTS) sends the value to the GASC which compares them with the set temperature and manages the BPV position. The BPV derives a part of the bleed air through the MHX to cool it and mix it to the remaining air.

The Engine Air Bleed System is supplied by BUS 2 bar and protected by the CAB BLEED breaker.

Dual zones environmental control system

The Environmental Control System is based on two independent air circuits. The heating circuit uses the controlled temperature bleed air. The cooling circuit is based on a Vapor Cycle System (VCS).

The Environmental Control System is designed to ensure the following functions:

- Cockpit / Cabin Heating function
- Cockpit / Cabin Cooling function.

The environmental control system is supplied by BUS 2 bar and protected by the AIR COND breaker. Four fans are supplied by BUS 4 bar and protected respectively by following breakers: COND FAN, CABIN FAN, COCKPIT FAN and GND FAN.

The system includes an automatic load shedding feature which:

- shuts off the Ground Fan (GF) and the Condenser Fan COND FAN and opens compressor clutch when MAIN GEN is ON.
- shuts off all the Vapor Cycle System (VCS) during engine start.

Heating circuit

Hot air coming from the bleed air system is mixed with the cabin recirculating air in the Mixing Ejector (MIXEJ) in order to lower the blown air temperature. The resultant air flow enters the Hot Air Distributor (HAD) and is distributed in the cockpit/cabin zones regarding the demand.

It is dispatched:

- in the cockpit through ports located on pedestal sides, under each seat or through the demisting outlets.
- in the cabin through ports located on the lower section of the L.H. side and R.H. side cabin upholstery.

The HOT AIR FLOW distributor allows to select the windshield defog / cabin heating functions.

When the A/C switch is set to OFF position, the temperature is set by default by the GASC to 23°C.

Cooling circuit

There are two separate circuits: one for the cockpit and the other for the cabin.

In each circuit, air is sucked by means of a variable speed electrical fan, then it is blown through an evaporator and ducted to the different zones:

- cockpit circuit: by passing into the upper panel equipped with 2 swivelling and adjustable air outlets, through air outlets located on arm rests of pilot and R.H. side front passenger stations and through ports located under instrument panel,
- cabin circuit: by passing into the overhead duct equipped with 4 swivelling and adjustable air outlets and through ports located on the floor between the cabinets and the intermediate passenger's seats.

The VCS can be switched on, only if the fans are set at least to minimum speed. The compressor clutch and the condenser fan are controlled by the GASC.

The blown air temperature is controlled by the system according to the settings of each temperature selector. The FAN speed selectors enable to control blow air speed of each fan of the cockpit and cabin evaporators.

The A/C switch allows to switch on or off the vapor cycle system.

- If set to OFF position, the VCS is switched to off.
- If set to PILOT position, the operation of the controls located in the cabin zone is inhibited.
- If set to PLT + PAX position, each zone is controlled per its own settings.

Emergency air control (EMERGENCY RAM AIR control knob), located under R.H. side area instrument panel facing control wheel, enables outside air to enter the cabin through a valve. In NORMAL position, the valve is closed and the control is locked. To open emergency ventilation valve, press on locking knob and move control rearwards.

Cabin pressurization control system

The cabin altitude check is automatically ensured by the pressurization control system through a monitoring of the cabin pressure. The opening of the Outflow Valve (OFV) is controlled by the GASC through a torque motor fitted on the valve.

The Landing Field Elevation entered by the pilot in the MFD is used by the GASC to manage the optimal cabin altitude rate of change in order to land with a cabin altitude equal to LFE minus 200 ft.

The Landing Field Elevation selection is done using:

- destination airport of the flight plan pressing SYSTEM and then FMS LFE on the MFD
- a manual entry pressing SYSTEM then MAN LFE on the MFD.

Pilot's Operating Handbook

The cabin altitude is automatically calculated by the GASC using the data sent by MFD.

In flight, the GASC controls the opening of the OFV in order to reach the automatic computed cabin altitude. The MODE pressurization switch allows to select 2 pressurization modes:

- if set to AUTO, the GASC controls the cabin altitude rate of change in order to optimize comfort and avoid reaching maximum ΔP or negative ΔP
- if set to MAX DIFF, the cabin altitude is minimized throughout the flight. For airplane altitudes below 13500 ft, this results in cabin altitudes that could be as low as 0 ft. Above 13500 ft, the cabin altitude is minimized while maintaining $\Delta P < 6.0$ PSI.

The MFD shows landing field altitude, cabin climb speed in Sea Level ft/min and cabin-atmosphere differential pressure (ΔP) in PSI.

Cabin is automatically depressurized as soon as the airplane is on ground through landing gear switch (airplane on ground) or, if necessary, by actuating DUMP switch located on A/C and PRESSURIZATION panel (in normal operation, this switch is protected and locked by a cover).

Overpressure and negative relief safety are managed by both OFV and SFV. The safety functions are ensured by independent pneumatic modules fitted on both valves, which override the GASC control when necessary.

MAX DIFF MODE appears in the MFD CAS window, in display normal conditions, when the MODE pressurization switch is set to MAX DIFF.

CABIN ALTITUDE appears in the MFD CAS window, in display normal conditions, when the cabin altitude is over 10000 ft.

CABIN DIFF PRESS appears in the MFD CAS window, in display normal conditions, when the cabin-atmosphere differential pressure is over 6.2 psi (427 mb).

The DUMP switch allows the pilot to open the OFV in order to de-pressurize the cabin. The OFV is fitted with a cabin altitude limitation device which overrides the DUMP function and forces the closure of the OFV if the cabin altitude reaches 14500 ft.

CPCS BACKUP MODE appears in the MFD CAS window when, due to malfunction, GASC cannot compute optimal cabin altitude.

In this case, cabin altitude is controlled by GASC to 9800 ft default value.

7.10 - Emergency oxygen system - see figure 7.10.1

The gaseous oxygen system will be used by the crew and the passengers, when the cabin altitude is greater than 10000 ft following a loss of pressurization or in case of cabin air contamination.

>> With v15 GARMIN software and voice alerts (Post-MOD70-0407-00D)

USE OXYGEN MASK appears in the MFD CAS window (in normal conditions) and the USE OXYGEN MASK/USE OXYGEN MASK aural warning alert sounds when the cabin altitude is greater than 10000 ft.

>> All

The oxygen reserve is contained in an oxygen cylinder made of composite material and located outside of the pressurized cabin into the R.H. karman. Its capacity is 50.3 cu.ft (1425 litres) STPD (Standard Temperature Pressure Dry) and use limit pressures are :

- maximum pressure 1850 PSIG (127 bars) at 70° F (21° C).
 Evolution of this pressure according to the outside temperature is given in section 8, figure 8.7.1, as well as on a placard on the inside of the cylinder service door,
- minimum pressure 217 PSIG (15 bars).

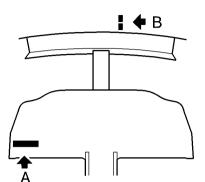

The oxygen cylinder head is equipped with:

- a hand-controlled isolation valve to permit cylinder installation and removal,
- a microswitch causing **OXYGEN** to light on. This message lights on, when the isolation valve is closed.
- a graduated pressure gage,
- a charging valve refer to the replenishment procedure in section 8.
- an overpressure system consisting of a safety disc. This disc is designed to rupture between 2500 and 2775 PSIG (172 and 191 bars) discharging the cylinder contents outboard,
- a pressure reducing valve adjusting utilization pressure to a value comprised between 64 and 85 PSIG (4.4 and 5.9 bars),
- a low pressure safety valve calibrated to 116 PSIG (8 bars).

Pilot's Operating Handbook

- 1) MICRO / MASK switch

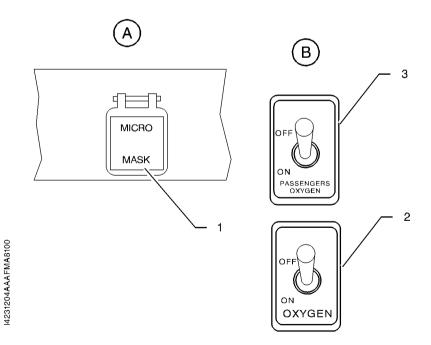

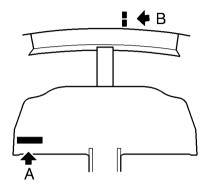

Figure 7.10.1 - Emergency oxygen system - Pre-MOD70-0485-11A

- 1) MICRO / MASK switch
- 2) OXYGEN switch
- 3) PASSENGER OXYGEN switch

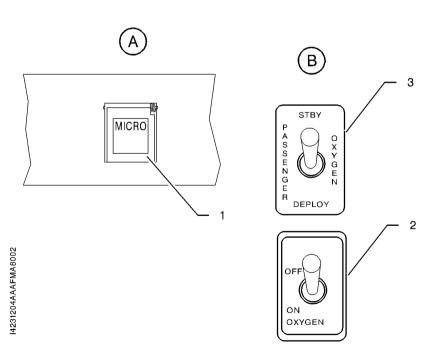

Figure 7.10.1A - Emergency oxygen system - Post-MOD70-0485-11A

A control panel located in the cockpit overhead panel at the disposal of the pilot includes:

- a two-position valve ON/OFF (OXYGEN switch) to permit the supply of the front seats occupiers masks,
- >> With PASSENGER OXYGEN switch ON/OFF (Pre-MOD70-0485-11A)
- a two-position valve ON/OFF (PASSENGERS OXYGEN switch) with guard to permit the supply of the passengers four masks, when the first valve is open.
- >> With PASSENGER OXYGEN switch STBY/DEPLOY (Post-MOD70-0485-11A)
- a two-position valve DEPLOY/STBY (PASSENGER OXYGEN switch) with guard to permit the supply of the passengers four masks, when the first valve is open.

>> All

Oxygen pressure is displayed on the MFD.

An altimetric valve provides an automatic passengers masks actuation function at a cabin altitude between 13000 and 14000 ft when OXYGEN switch is set to ON.

Two pressure-demand type masks allowing quick donning with only one hand, covering the nose and the mouth, as well as two pairs of smoke goggles are at disposal of the pilot and of the R.H. front seat occupier. Masks are installed in cups on the cabin walls aft of the front seats. Permanently connected to the oxygen system, they are equipped with a micro controlled by the MICRO/MASK switch under cover located on the instrument panel near the pilot's control wheel. The cockpit masks are equipped with a microphone, a three-position selector NORMAL, 100 % and EMERGENCY and with a push-button PRESS TO TEST. The proper flow is signaled by a flow indicator (blinker) into the oxygen tubing.

The airplane is equipped with two smoke goggles.

Four passengers constant-flow type masks, covering the nose and the mouth and permanently connected, are installed in two containers on the cabin ceiling. The opening of these containers and the descent of the masks are controlled by the pilot, when both switches at its disposal are set to ON, or automatically at a cabin altitude between 13000 and 14000 ft with the OXYGEN switch set to ON. The oxygen flow is obtained by pulling on the mask bounded by a lanyard cord to a pin. A proper flow is signaled by the filling of the green bag located on each passenger mask.

▲ WARNING ▲

Do not smoke during oxygen system use.

Oil, grease, soap, make up, lipstick and any other greasy substances constitute a serious fire or burning hazard, when on contact with oxygen.

Flight above 15000 ft with possible emergency descent

Minimum oxygen pressure (PSIG) for following conditions:

- 4 minutes from 31000 to 15000 ft. All equipment used from 31000 ft.
- Plus 30 minutes usage by each pilot and passenger at 15000 ft.
- Plus 86 minutes usage by each pilot at 10000 ft.

Intentionally left blank

7.11 - Air data system and instruments - see figure 7.11.1

Airplane air data system consists of :

 two separate static pressure systems supplying an electronic standby indicator and air data computers (ADC).

A part of system 1 is backed up by an alternate system which operation is controlled by a switching valve (normal/alternate) attached to instrument panel under R.H. control wheel. In case of obstruction or icing of ports, this selector isolates airplane normal static system. When selector is on alternate position (pulled rearwards), static pressure is picked from a port located in airplane rear fuselage.

 two separate dynamic pressure systems supplying the electronic standby indicator and air data computers.

Static pressure systems

Primary systems

Two dual static ports (one on either side of the fuselage tail part) supply a dual system routed towards the cockpit.

System 1 part, which is connected to the switching valve (normal/alternate), supplies the ΔP cabin and the electronic standby indicator. The system remainder directly supplies one of the air data computers.

System 2 is directly connected to the second ADC.

Systems feature a drain valve located under the instrument panel on R.H. side.

Alternate static source

The alternate static port located in the rear fuselage supplies a system routed to the switching valve (normal / alternate) in order to replace static system 1.

The alternate line incorporates a drain plug located under the instrument panel on R.H. side.

Dynamic pressure system

One heated pitot probe is installed under the L.H. wing. The second one is installed under the R.H. wing. The first one supplies the electronic standby indicator and one ADC.

The second one supplies the other ADC.

Both lines incorporate a drain plug located in the root of L.H. and R.H. wings.

Pitot heating

Pitot heating is controlled by PITOT L HTR and PITOT R & STALL HTR switches, installed on DE-ICE SYSTEM panel. Refer to chapter 7.13 for further details.

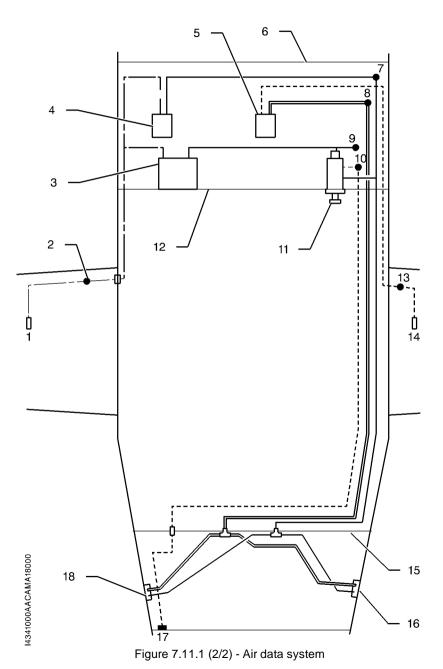

Do not use heating during prolonged periods on ground to avoid pitot overheat.

7.12 - Vacuum system and instruments - see figure 7.12.1

The airplane is fitted with a vacuum system providing the suction necessary to operate the cabin pressurization and the leading edge deicing.

Vacuum system includes:

- A pressure regulator
- An ejector
- A regulating and relief valve
- A pressure switch

Compressed air necessary for the ejector to create decompressed air is taken from the powerplant. The air flow is regulated before going into the ejector which creates necessary vacuum by venturi effect.

A relief valve fixed in cabin to frame C2, maintains the vacuum for pressurization system. In case of pressure drop, a pressure switch, installed in the system, indicates the failure by causing **VACUUM LOW** to light on.

Electronic standby indicator (ESI-2000)

The L-3 communications avionics systems ESI-2000 electronic standby instrument system consists of an AMLCD display. An air data sensor is integral to the ESI-2000 housing. A replaceable battery assembly provides back up power. The electronic standby indicator displays attitude (pitch and roll), along with altitude and airspeed. The ESI-2000 is powered from the ESS BUS 2, or internal battery ensuring that the airplane can continue safe flight and landing in the event of a loss of primary attitude and air data displays. Pitot and static pressures are provided to the ESI-2000 using the airplane pitot probe and static sources.

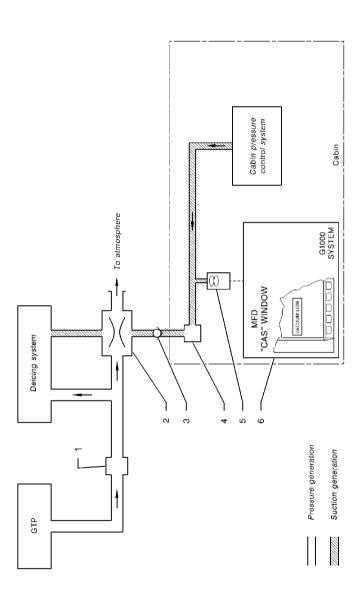

Figure 7.12.1 (2/2) - Vacuum system

7.13 - Ice protection equipment - see figure 7.13.1

Ice protection equipment is as follows:

- Pneumatic deice system for inboard, central and outboard wing and for stabilizers: AIRFRAME DE ICE
- Propeller electrical deice system : PROP DE ICE
- Windshield electrical deice system : WINDSHIELD
- Electrical heating system for both pitots and for the stall warning sensor :
 PITOT L HTR and PITOT R & STALL HTR
- Turbine air inlet deice systems: INERT SEP

Deicing check and control panel is located on the lower L.H. side of the instrument panel.

Wing and empennage deicing

A pneumatic deice system assures protection of wing leading edges, horizontal stabilizer, elevator horns and vertical stabilizer. The system automatically cycles when AIRFRAME DE ICE switch is set to ON. The 67-second cycle breaks down in two inflation cycles:

- a first cycle induces inflation of leading edges deicer boots in wing central and outboard sections.
- the second cycle induces inflation of leading edges deicer boots in horizontal stabilizer, elevator horns, vertical stabilizer and wing inboard section,

During each inflation cycle, one of the two corresponding warning lights located above AIRFRAME DE ICE switch, remains illuminated.

Wing leading edge icing inspection light - see chapter 7.8 paragraph Exterior lighting.

Propeller deicing

Propeller deicing is accomplished through electrical heating of blade roots. This system operates cyclically and alternately on the inboard and outboard zones of all blades. Each cycle is 180 seconds long. The system operation is correct when green warning light located above PROP DE ICE switch illuminates. The cycles continue as long as the switch remains set to ON.

PROP DEICE ON illuminates if the engine is shut down with PROP DE ICE switch still ON.

▲ CAUTION ▲

When engine is shutdown, do not set the PROP DE ICE switch to ON, damage to the propeller blades could result.

Windshield deicing

The windshields are deiced electrically by integrated heating resistors. The system includes a controller and two heat probes embedded in each windshield. They are operated by the WINDSHIELD switch.

When the switch is positioned to ON, the controller supplies the heating resistors, the windshield temperature is monitored by probe 1. When the temperature reaches 45°C (113°F), the controller cuts the electrical supply to the heating resistors and resumes supply when the temperature falls below 30°C (86°F). The cycle continues as long as the switch remains set to ON.

In the event of failure of probe 1, the controller receives the temperature data from probe 2. The electrical supply to the heating resistors is cut when the windshield temperature reaches 56°C (133°F). In that case, the windshield is no longer heated, the pilot can reset the system by setting the switch to OFF, then to ON.

Two green lights located above the WINDSHIELD switch go on when the corresponding heating resistors are being supplied.

Heating of pitots and stall warning sensor (PITOT L HTR and PITOT R & STALL HTR)

The two pitots, which supply ADCs, the airspeed indicator and the stall warning sensor are electrically heated. This deice equipment must be used even during flight into non-icing conditions.

The system condition messages PITOT NO HT L or PITOT NO HT R,

PITOT HT ON L or PITOT HT ON R, STALL HEAT ON or

STALL NO HEAT are displayed on the MFD CAS window. Refer to the GARMIN Cockpit Reference Guide for further details.

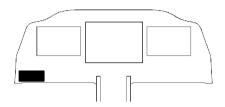

NOTE •

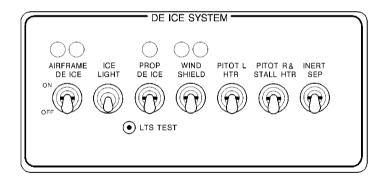

Correct operation of the audible stall warning may be altered by severe or prolonged icing.

Turbine air inlet protection

Operation and description are set forth in chapter 7.6 paragraph Engine air inlet.

7.14 - Miscellaneous equipment

Stall warning system

The airplane is equipped with an electrically deiced stall sensor in the leading edge of the right wing. This sensor fitted with a vane is electrically connected to an audible warning. The vane senses the change in airflow over the wing and operates the warning unit, which produces an aural warning alert over the alarm speaker. This warning alert begins between 5 and 10 knots above the stall in all configurations.

>> With stick shaker installation (Post-MOD70-0510-27)

Simultaneously, the control wheel vibrates through the stick shaker.

>> All

The stall warning system should be checked during the preflight inspection by momentarily turning on the SOURCE selector and by manipulating the vane in the wing.

>> With Angle of Attack system (Post-MOD70-0423-34A)

The stall warning system should also be checked during the preflight inspection by momentarily turning on the SOURCE selector and by depressing the TEST push-button on cockpit overhead panel.

>> Without voice alerts (Pre-MOD70-0407-00)

The system is operational if a continuous tone (low-pitched sound) is heard on the alarms speaker.

>> With voice alerts (Post-MOD70-0407-00)

The system is operational if a stall aural warning alert is heard on the alarms speaker.

NOTE •

The audible stall warning may be altered by severe or prolonged icing.

Static dischargers

As an aid in flight, static dischargers are installed to improve radio communications during flight by reducing interference from dust or various forms of precipitations (rain, snow or ice crystals).

Under these conditions, the build-up and discharge of static electricity from the trailing edges of the wings (flaps and ailerons), rudder, stabilator, propeller tips and radio antennas can result in loss of usable radio signals on all communications and navigation radio equipment. Usually, the ADF is first and VHF communication equipment is the last to be affected.

Installation of static dischargers reduces interference from precipitation static, but it is possible to encounter severe precipitation static conditions which might cause the loss of radio signals, even with static dischargers installed. Whenever possible, avoid known severe precipitation areas to prevent loss of dependable radio signals. If avoidance is impractical, minimize airspeed and anticipate temporary loss of radio signals while in these areas.

Cabin fire extinguisher

The fire extinguisher is located on R.H. front station side panel.

A pressure gage allows checking the fire extinguisher condition. Follow the recommendations indicated on the extinguisher.

Autopilot

Autopilot control panel is located above the MFD. Refer to section 2 Limitations of this POH and to GARMIN Cockpit Reference Guide for further details.

GPS

GPS navigation is performed through the GARMIN system. Refer to section 2 Limitations and section 4 Normal procedures of this POH and to GARMIN Cockpit Reference Guide for further details.

Weather radar GWX 70

The weather information can be displayed on MFD.

Refer to section 2 Limitations of this POH and to GARMIN Cockpit Reference Guide for further details.

The controls for the MFD are located on both the MFD bezel and the MFD control unit.

- 1) MFD
- 2) Radar mode
- 3) Area of weather display
- 4) Antenna stabilization status
- 5) MFD bezels
- 6) MFD control unit
- 7) Changes radar range, TILT and bearing
- 8) Scale for weather display

Emergency locator transmitter

The airplane is equipped with an ELT ARTEX 1000 emergency locator transmitter which enables to locate it in case of distress. It is located in fuselage rear section with a service door on fuselage R.H. side.

The emergency locator transmitter assembly is constituted of a transmitter supplied by a battery, of an antenna attached on upper fuselage and of a remote control located on the upper panel.

NOTE •

For test sequences, refer to manufacturer manual.

•

Operation of the emergency locator transmitter is obtained as follows:

- from the instrument panel by setting ELT remote control switch to ON (locator transmitter ARM/OFF switch set to ARM/OFF),
- from the locator transmitter by setting its ARM/OFF control switch to ON,
- automatically in case of shock, when remote control switch is set to ARM/OFF and locator transmitter switch is set to ARM/OFF.

A red indicator light located on ELT remote control switch in the cockpit indicates to the pilot the emergency locator transmitter is transmitting.

A red indicator light located above locator transmitter switch and a buzzer located in the fuselage rear section indicate the emergency locator transmitter is transmitting.

▲ CAUTION ▲

Reset the ELT after an inadvertent activation.

NOTF •

The ELT cannot be reset if either the remote control switch or ELT switch is ON.

•

Reset procedure:

- Set remote control switch or ELT switch to ON.
 - a) The ELT keeps on transmitting emergency signal.
 - b) On remote control box, red indicator light flashes.
 - c) On ELT, red indicator light flashes.
 - d) Near ELT, the buzzer sounds.
- Wait approximately for 1 second.

- 3) Set remote control switch to ARM/OFF or ELT switch to ARM/OFF.
 - a) The ELT does not transmit emergency signal any longer.
 - On remote control box, red indicator light illuminates for about 1 second, then goes off.

or

- c) On ELT, red indicator light goes off.
- d) Near ELT, the buzzer does no more sound.

Then ELT is reset.

End of procedure.

Flight deck information system (FS 210), if installed

The airplane is equipped with a flight deck information system allowing portable electronics devices to stream data to and from the GARMIN system.

For the system description and its utilization, refer to GARMIN Cockpit Reference Guide.

Lightweight data recorder (LDR 1000), if installed

The airplane is equipped with a lightweight data recorder which is a crash-survivable system, recording both cockpit voices and flight data. These data are intended to be used after an accident or an incident.

The lightweight data recorder system includes a cockpit microphone located on instrument panel, between the Electronic Standby Instrument and the autopilot control panel.

The lightweight data recorder simultaneously records audio from both GMA 1 and GMA 2 audio control panels, audio from the cockpit microphone, data from the GASC, and data from the GIA integrated avionics unit 1 (GARMIN flight deck system).

The lightweight data recorder is powered from the BATT BUS and controlled by a printed circuit as follows :

- If the crash lever is set upward, the lightweight data recorder starts recording.
- If the crash lever is set downward, the lightweight data recorder goes on recording for 10 minutes (audio only) and then automatically stops recording.

Optional equipment

For optional equipment such as stormscope, SVS or TAWS, refer to section 9 Supplements.

Other optional equipment such as radio altimeter or chartview system or TAS are described in the GARMIN Cockpit Reference Guide.

Refer to section 2 Limitations for chartview system operating limitations.

8.1 - General

This section contains the procedures recommended by the manufacturer for the proper ground handling and routine care and servicing of airplane. Also included in this section are the inspection and maintenance requirements which must be followed if your airplane is to retain its performance and dependability.

It is recommended that a planned schedule of lubrication and preventive maintenance be followed, and that this schedule be tailored to the climatic or flying conditions to which the airplane is subjected.

For this, see manufacturer maintenance manual.

8.2 - Identification plate

Any correspondence regarding your airplane should include its serial number. This number together with the model number, type certificate number and production certificate number are stamped on the identification plate attached to the left side of the fuselage beneath the horizontal stabilizer.

8.3 - Publications

When the airplane is delivered from the factory, it is supplied with a POH, the GARMIN Integrated Flight Deck Pilot's Guide and supplemental data covering optional equipment installed in the airplane (refer to section 9 Supplements and pilot guides).

In addition, the owner may get access to the following publications online:

- Maintenance Manual
- Illustrated Parts Catalog
- Catalog of Service Bulletins, Service Letters

POH must always be in the airplane.

8.4 - Inspection periods

Refer to regulations in force in the certification country for information concerning preventive maintenance to be carried out.

A maintenance manual must be obtained prior to performing any preventive maintenance to make sure that proper procedures are followed. Maintenance must be accomplished by licensed personnel.

8.5 - Alterations or repairs

It is essential that the airworthiness authorities be contacted prior to any alterations or repairs on the airplane to make sure that airworthiness of the airplane is not violated. Alterations or repairs must be accomplished by licensed personnel.

8.6 - Ground handling

▲ CAUTION ▲

Only move or tow the airplane with someone in the cockpit.

lack

Towing

▲ CAUTION ▲

Using the propeller for ground handling could result in serious damage, especially if pressure or pull is exerted on blade tips.

The airplane should be moved on the ground with a towing bar and a suitable vehicle in order not to damage the nose gear steering mechanism. Nose gear fork is equipped with an integrated towing fitting.

▲ CAUTION ▲

Do not tow the airplane when controls are secured.

When towing with a vehicle, do not exceed the nose gear turning angle, as this may result in damage to the gear and steering mechanism - see figure 8.6.1

Parking

When parking the airplane, head it into the wind. Do not set the parking brake when brakes are overheated or during cold weather when accumulated moisture may freeze the brakes. Care should be taken when using the parking brake for an extended period of time during which an air temperature rise or drop could cause difficulty in releasing the parking brake or damage the brake system.

Make sure that the FUEL TANK SELECTOR is set to OFF.

NOTE •

Do not use solar screens or shields installed on the airplane inside, or leave sun visors down against windshield when airplane on ground. The reflected heat from these items causes a temperature increase which accelerates the crack growth or crazing and may cause the formation of bubbles in the inner layer of multilayer windshields.

•

Beyond 24 hours parking, use windshield protection screen provided with lateral and underside straps.

For long term parking, blanking covers (static ports, pitot, engine air inlet, NACAs, exhaust stubs), cockpit cover, tie-downs, wheel chocks, propeller lock and control lock are recommended.

In severe weather and high wind conditions, tie the airplane down as outlined in the following paragraph.

Tie-down

Proper tie-down procedure is the best protection against damage to the airplane by gusty or strong winds. To tiedown the airplane securely, proceed as follows:

- Install control lock see figure 8.6.2.
- Chock all wheels.
- Tie sufficiently strong ropes or chains to hold airplane down; insert a rope in each tie-down hole located on flap hinge arm; secure each rope to a ramp tie-down or to mooring rod.
- Check that doors are closed and locked.

Figure 8.6.1 - Turning angle limits

Jacking

When it is necessary to jack the airplane off the ground, refer to maintenance manual for specific procedures and equipment required.

Leveling

Level the airplane as described in maintenance manual.

Flyable storage (below 28 days)

Airplanes placed in storage for a maximum of 28 days are considered in flyable storage.

Storage from 0 to 7 days:

Engine: according to maintenance manual P & W C.

Airplane fueling:

 Keep fuel tanks full to minimize condensation in the tanks. Keep the battery fully charged to prevent the electrolyte from freezing in cold weather.
 Close oxygen cylinder isolation valve.

Storage from 8 to 28 days:

Engine : according to maintenance manual P & W C.

Airplane fueling:

 Keep fuel tanks full to minimize condensation in the tanks. Keep the battery fully charged to prevent the electrolyte from freezing in cold weather.
 Close oxygen cylinder isolation valve.

Battery, remaining in the airplane or removed:

Disconnect battery and check its charge level at regular intervals.

Long term storage without flying (over 28 days)

Refer to maintenance manual for the procedures to follow.

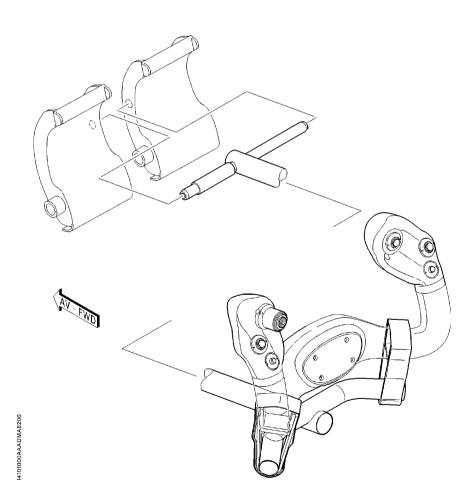

Figure 8.6.2 - Control lock device

8.7 - Servicing

Maintenance

In addition to the preflight inspection, refer to section 4, Normal procedures, servicing, inspection and test requirements for the airplane are detailed in the maintenance manual.

Maintenance manual outlines all items which require servicing, inspection, testing or overhaul.

Engine oil

Type of oil

Do not mix different viscosities or specifications of oil as their different chemical structure can make them incompatible.

Specification

6 Quarts (5.7 Litres)

Servicing

The engine oil should be changed and the oil filter cleaned/replaced at intervals recommended in Pratt & Whitney Canada Engine Maintenance Manual (EMM) (Ref. chapter 72-00-00, table 601, periodic inspection).

Oil level check

To avoid overfilling of oil tank, and high oil consumption, an oil level check is recommended within 30 minutes after engine shutdown. Ideal interval is 15 to 20 minutes. If more than 30 minutes have passed and the dipstick indicates that oil is needed, start the engine and run at LO-IDLE for five minutes, and recheck oil level.

Check oil level against marking on dipstick and top-up as required. Normal oil level is between MAX HOT and one US quart (0.83 lmp. Quart, 0.95 litres) below MAX HOT, with engine in horizontal attitude.

NOTF •

Filling the oil to the maximum level may result in high consumption rate, with the oil exiting through the accessory gearbox breather.

▲ CAUTION ▲

When filler cap assembly is installed and locked, no movement is allowed.

_

Fuel

Total capacity each tank: 150.5 USG (570 I).

NOTE •

To minimize condensation, it is recommended that airplane be refueled after each flight, respecting weight and balance limits.

▲ CAUTION ▲

Never fly the airplane with contaminated (water, sand, rust, dust...) or unapproved fuel

Before each flight and after each fueling, use a sampler to bleed off some fuel through each tank and fuel filter drain to detect possible contamination and be sure that fuel used is the proper quality. If contamination is present, continue draining through all draining points until fuel is free of contamination. If quality of fuel used is not correct, defuel airplane completely and refuel with proper quality fuel.

▲ WARNING ▲

During all fueling operations, fire fighting equipment must be available; attach grounding wire to an unpainted metallic part of the airplane.

Do not operate any avionics or electrical equipment on the airplane during fueling. Do not allow open flame or smoking in the vicinity of the airplane while fueling.

▲ CAUTION ▲

During fueling operations, take care not to damage pneumatic deicer boots located on wing leading edge.

The use of aviation gasoline (AVGAS) must be restricted to emergencies only. AVGAS will not be used for more than 150 cumulative hours during any period between engine overhaul.

NOTE •

Use of AVGAS must be recorded in engine module logbook.

•

US Specification (US)	French Specification (FR)	English Specification (UK)	NATO Code

	AIR 3404C Grade F43	DERD 2498 Issue 7	F43 without additive

Figure 8.7.2 - Recommended fuel types Reference : Service Bulletin P & W C. No. 14004

Fuel additives

Fuel used must contain an anti-ice additive conforming to MIL-I-27686 or MIL-I-85470 specification.

Strict adherence to recommended preflight draining instructions as called for in Section 4 will eliminate any free water accumulations from the tank sumps. While small amounts of water may still remain emulsified in the gasoline, it will normally be consumed and go unnoticed in the operation of the engine.

One exception to this can be encountered when operating under the combined effect of use of certain fuels, with high humidity conditions on the ground followed by flight at high altitude and low temperature. Under these unusual conditions, small amounts of water emulsified can precipitate from the fuel stream and freeze in sufficient quantities to induce partial icing of the engine fuel system.

While these conditions are quite rare and will not normally be a problem to owners and operators, they do exist in certain areas of the world and consequently must be dealt with, when encountered.

Therefore, to alleviate the possibility of fuel icing occurring under these unusual conditions, it is required to add an ethylene glycol monomethyl ether (EGME or DIEGME) compound to the fuel supply.

The introduction of an EGME or DIEGME compound into the fuel provides two distinct effects:

- it absorbs the dissolved water from the fuel.
- alcohol has a freezing temperature depressant effect.

EGME or DIEGME must be carefully mixed with the fuel in concentration, it must be between a minimum of 0.06 % and a maximum of 0.15 % by volume. Figure 8.7.3 provides EGME or DIEGME / fuel mixing ratio information.

▲ CAUTION ▲

Do not permit the concentrate of EGME or DIEGME to come in contact with the airplane finish or fuel tank

Mixing of the EGME or DIEGME with the fuel is extremely important. An excessive concentration (greater than 0.15 % by volume maximum) will result in detrimental effects to the fuel tanks by deterioration of protective primer, sealants and seals of system and engine components. Use only blending equipment recommended by the manufacturer to obtain proper proportioning.

Prolonged storage of the airplane will result in a water buildup in the fuel which leeches out the additive. An indication of this is when an excessive amount of water accumulates in the fuel tank sumps. The concentration can be checked using a differential refractometer. It is imperative that the technical manual for the differential refractometer be followed explicitly when checking the additive concentration.

Fuel and fuel additives in Ukraine and CIS countries

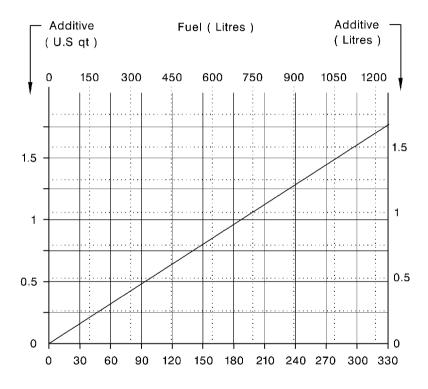

It is possible to use kerosene GOST 10227 RT with addition of anti-icing liquid:

- liquid И - GOST 8313-88

Above-mentioned liquid is added in the quantity equal to 0.3 percent per volume.

Refer to Service Bulletin P & WC No. 14004 at its latest revision for appropriate quantities.

Fuel (U.S Gal)

14284000AAAEMA8000

Figure 8.7.3 - Additive mixing ratio (EGME or DIEGME)

Landing gear

Nose gear tire

5.00-5 10 PR - Inflation pressure: 98 psi (6.7 bars) *

Main gear tires

18 5.5 10 PR - Inflating pressure: 135 psi (9.32 bars) *

Nose gear shock absorber

Fill with hydraulic fluid AIR 3520 B (MIL.H5606E); inflate with nitrogen to 87 psi (6 bars).

Main gear shock absorbers

Fill with hydraulic fluid AIR 3520 B (MIL.H5606E); inflate with nitrogen to 160 psi (11 bars).

Hydraulic system

Check every 100 hours and service with AIR 3520 B (MIL.H5606E) hydraulic fluid.

Brakes

Service as required with AIR 3520 B (MIL.H5606E) hydraulic fluid.

NOTE •

A higher inflation pressure has to be applied to tires and shock absorbers when in very cold conditions - refer to chapter 8.9.

•

(*) Tire inflation pressures are given for an airplane on ground at 21° C. An ambient temperature change of 3° C produces approximately 1 % pressure change.

Oxygen

The replenishment device of the oxygen cylinder is installed directly on the cylinder head. It consists of a charging valve and of a pressure gage graduated from 0 to 2000 PSIG. A chart - see figure 8.7.4, located on the inside of the cylinder service door, gives the cylinder charge maximum pressure according to the environment temperature.

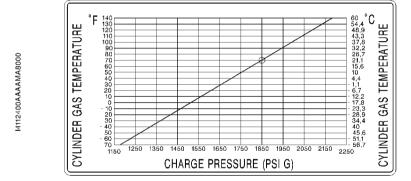

Figure 8.7.4 - Charge pressure chart

Replenishment procedure

▲ WARNING ▲

Make sure that the airplane is fitted with a grounding cable and is properly grounded.

The oxygen cart must be electrically bonded to the airplane.

Do not operate the airplane electrical switches or connect/disconnect ground power during oxygen system replenishment.

Do not operate the oxygen system during refueling/defueling or perform any other servicing procedure that could cause ignition.

Introduction of petroleum based substances such as grease or oil to oxygen creates a serious fire hazard. Use no oil or grease with the oxygen replenishment equipment.

Always open shut-off valve slowly to avoid generating heat and replenish the system slowly at a rate not exceeding 200 PSIG (13.7 bars) per minute.

▲ CAUTION ▲

Replenishment of the oxygen system should only be carried out by qualified personnel.

NOTF •

The cylinder full charge is assured for a pressure of 1850 PSIG (127 bars) at a temperature of 70° F (21° C). If the cylinder temperature differs from 70° F (21°C), refer to figure 8.7.4 which lists the required pressures according to the cylinder temperature.

- 1 -Open the oxygen service door on the R.H. rear karman.
- 2 -Measure the oxygen cylinder temperature.
- 3 -Make sure the thermometer indication is constant. Note the indication.
- 4 -Refer to the temperature/pressure chart for the correct oxygen cylinder pressure.

If the pressure on the oxygen cylinder gage is low:

Fill the oxygen cylinder

- Make sure the area around the oxygen cylinder charging valve is clean.
 Remove the cap from the charging valve.
- 6 Make sure the oxygen supply hose is clean and connect it to the charging valve.
- 7 Slowly pressurize the oxygen cylinder to the correct pressure.
- 8 Close the oxygen supply and let the cylinder temperature become stable.
- Monitor the oxygen pressure on the gage and fill to the correct pressure if necessary.
- 10 Release the pressure in the oxygen supply hose and disconnect from the charging valve.
- 11 Install the cap on the charging valve.
- 12 Make sure all the tools and materials are removed and the work area is clean and free from debris.
- 13 Close the oxygen service door.

Passenger masks repacking instructions

▲ CAUTION ▲

Do not use oil or other petroleum based lubricants on passenger oxygen mask or deployment container. Oil based lubricants are a fire hazard in oxygen-rich environments.

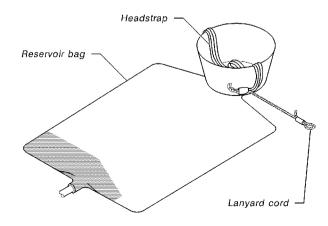

Repacking procedures shall be performed by personnel familiar with the instructions and warnings in this document. Improperly packed masks can damage the masks or result in failure of the masks to deploy.

▲ WARNING ▲

Masks shall be repacked in an area free of oil, grease, flammable solvents or other contaminants.

- 1 Inspect and disinfect mask and deployment container with an aqueous solution of Zephiran Chloride (Scott Aviation P/N 00-2572) or with disinfection cleaners (EROS P/N SAN50). After disinfecting and thoroughly drying the mask, lightly dust the outside of the facepiece with Neo-Novacite powder (Scott Aviation P/N 00-736). Contamination can be removed with mild soap and water solution.
- Fold headstrap into facepiece. Pull lanyard cord out to side of facepiece so that it does not interfere with repacking.
- 3 Lay reservoir bag on flat surface and smooth out wrinkles.

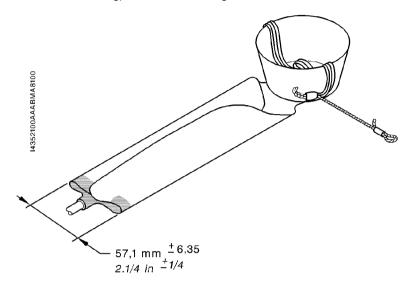

4352100AAABMA8300

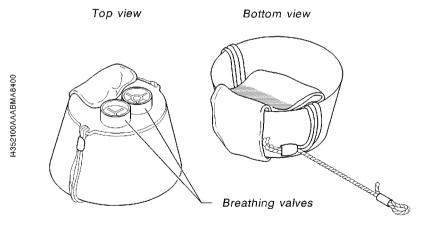

Pilot's Operating Handbook

4 - Gently fold reservoir bag lengthwise into thirds (outside edges folded inward over center of bag). Do not crease bag.

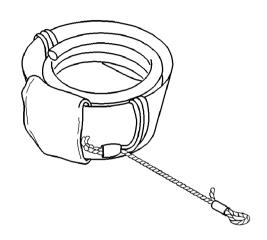

5 - Fold reservoir bag away from breathing valves and into facepiece. Make sure bag does not cover breathing valves.

6 - Coil oxygen tubing inside facepiece over reservoir bag.

7 - Connect oxygen tubing to manifold oxygen fitting.

Make sure lanyard pin is inserted into correct check valve for mask being installed. Cross connected pins will result in passengers pulling lanyard cords only to initiate oxygen flow to another mask.

- 8 Insert lanyard pin into corresponding check valve.
- 9 Place mask facepiece first in deployment container. Make sure that oxygen tubing and lanyard cord are free to deploy and are not caught between the container and lid.
- 10 Close and latch deployment container lid.

Section 8 Handling, servicing and maintenance

Intentionally left blank

8.8 - Airplane cleaning and care

Windshield and windows

The windshield and windows should be cleaned with an airplane windshield cleaner.

NOTE •

Refer to the maintenance manual for products and procedures to apply.

•

Apply the cleaner sparingly with soft cloths and rub with moderate pressure until all dirt, oil scum and bug stains are removed. Allow the cleaner to dry, then wipe it off with soft flannel cloth.

▲ CAUTION ▲

Do not use any of the following products on, or for cleaning windows: methanol, methylated alcohol, gasoline, benzene, xylene, methyl-ethyl-ketone, acetone, carbon tetrachloride, lacquer paint thinners, commercial or household window cleaning sprays. In case of doubt concerning a product, do not use it.

During cleaning operation, avoid wearing objects such as ring, watch, bracelet and exercise care to prevent buttons, buckles and any hard objects from touching the windshield and the windows.

Adhesive tapes other than Minnesota 3m type 670 shall not be used on acrylic surfaces.

Never use buffing machines as excessive forces or speeds might produce redhibitory defects.

Follow by carefully washing with a mild detergent and plenty of water. Rinse thoroughly, then dry with a clean moist chamois. Do not rub the plastic with a dry cloth since this builds up an electrostatic charge which attracts dust. Waxing will finish the cleaning operation. A thin, even coat of wax polished out by hand with clean soft flannel cloth will fill in minor scratches and help prevent further scratching.

Do not use a canvas cover on the windshield unless freezing rain or sleet is anticipated since the cover may scratch the plastic surface.

Painted surfaces

Refer to maintenance manual for the products and procedures to apply.

Propeller care

Preflight inspection of propeller blades for nicks and cleaning them occasionally with a cloth soaked with soapy water to clean off grass and bug stains will assure long blade life. Never use an alkaline cleaner on the blades; remove grease and dirt. Refer to maintenance manual for the procedures to follow.

Engine care

Refer to maintenance manual for the procedures to follow.

Interior care

To remove dust and loose dirt from the upholstery and carpet, clean the interior regularly with a vacuum cleaner.

For additional information, refer to maintenance manual.

- Preparation of the airplane (equipment and furnishings) 8.9

▲ WARNING ▲

In any accommodation, make sure access to emergency exit is free.

▲ CAUTION ▲

Removed equipment items must be stowed in a place which ensures their integrity.

Many accommodations are authorized by airplane manufacturer. They are enumerated in section 7.

This procedure specifies how to change your 6-seat accommodation into 4-seat accommodation, and conversely. However, it can be used partly to remove or install an equipment item.

However, the pilot must ensure that he gets all necessary authorizations from his regulatory authority.

- 1 -Conversion of 6-seat accommodation into 4-seat accommodation see figures 8.9.1, 8.9.2, 8.9.3 and 8.9.4
 - A Tools and consumable materials
 - Seat protective covers
 - B Preparation
 - 1) Make sure the SOURCE selector is set to OFF and the crash lever is down.
 - C Removal of rear seats see figure 8.9.1
 - 1) To remove rear seats, perform the following operations

▲ CAUTION ▲

In order to prevent cushion covering damage, protective covers should be put on seats.

- a) Install protective covers.
- Unlock backrest using backrest tilting handle (6) and fold it b) forward.

NOTE •

For the R.H. rear seat, backrest tilting handle is located behind backrest.

•

- c) Clear the carpet from under the seat to facilitate moving in rails.
- d) Unlock seat using seat tilting handle (1) and tilt it forward.
- e) Hold the seat in tilted position and unscrew quick links (7) of strap (9) located under L.H. seatpan.

NOTE •

This operation is specific to L.H. seat.

•

- f) Pull up and hold L.H. and R.H. rings (2), and turn knobs (8) by 90° in order to release and keep locks (3) in up position.
- g) Move the seat in the rails to line up pads (4) with rail (5) apertures.
- h) Remove the seat.

NOTE •

Ensure proper storage of strap (9) with L.H. rear seat to avoid loosing part.

•

- D Removal of intermediate seats see figures 8.9.2 and 8.9.3
 - 1) To remove intermediate seats, perform the following operations
 - a) Install protective covers.
 - b) Pull backrest bottom upholstery (25) to remove it.
 - c) Clear the carpet from under the seat to facilitate moving in rails.
 - Pull up locking handle (21) located under the pan, on the seat rear side, to unlock it.
 - e) Move the seat in the rails to line up pads (23) with rail (24) apertures.
 - f) Remove the seat.
 - g) Install backrest bottom upholstery (25).

▲ CAUTION ▲

In order to prevent deflectors damage, it is necessary to remove them.

 \blacktriangle

2) Remove deflector (34) maintained with Velcro-type strap.

3) If necessary, remove the cabin central carpet.

NOTE •

If one of two cargo nets must be installed, it is necessary to use the carpet with appropriate cuttings.

E - Removal of a cabinet

NOTE •

This operation must be carried out by a service center.

F - Cabin comfort - see figure 8.9.3

- Blank off the hot air outlet, located forward the large door, with blanking device assy (33) stored in storage bag - see figure 8.9.3 detail A.
- 2) Remove blanking plugs (32) located forward the large door and store them into storage bag - see figure 8.9.3 detail B.
- 3) Remove blanking plugs (31) located in line with R.H. front side window - see figure 8.9.3 detail C, and install them on holes located in line with card table - see figure 8.9.3 detail D.
- G Installation of intermediate seats see figures 8.9.2, 8.9.3 and 8.9.4
 - 1) Install deflector (34), ensuring that both red marks (36) are aligned with the deflector holes (35) - see figure 8.9.4.

NOTE •

Position deflectors (34) as indicated on label, according to future position of intermediate seat.

2) Install intermediate seats.

NOTE •

If seats are installed facing flight direction (frontwards), the L.H. seat must be installed on the right and the R.H. seat on the left in order to have the armrest on aisle side.

- Pull backrest bottom upholstery (25) to remove it. a)
- b) Clear the carpet from seat area to facilitate moving in rails.

Pilot's Operating Handbook

 Position the seat and put lock (22) near the color mark (37) made on rail bottom on aisle side.

NOTE •

The color mark (37) in the rail is aligned with red marks (36).

•

- d) Pull up locking handle (21), insert pads (23) into rail (24) apertures and then, move the seat so that lock (22) is in front of the color mark (37).
- e) Release locking handle (21) to lock the seat.

▲ WARNING ▲

Verify that lock (22) and all pads (23) are engaged and locked into rails, trying to move seat forward and backward.

A

f) Install backrest bottom upholstery (25).

NOTE •

Adjust it properly; make sure not to obstruct deflector (34) outlet.

•

- g) Slide properly the carpet under the seat.
- h) Remove protective covers.
- H Final operations
 - 1) If removed, install cabin central carpet suited to the intended use.

NOTE •

Slide properly the carpet under doorstep.

•

- 2) If necessary, remove the baggage compartment partition net and install the small or large cargo net refer to section 7.
- 3) Make sure the work area is clean and free from debris.
- 4) Determine weight and balance refer to section 6.
- 2 Conversion of 4-seat accommodation into 6-seat accommodation see figures 8.9.1, 8.9.2, 8.9.3 and 8.9.4
 - A Tools and consumable materials
 - Seat protective covers

B - Preparation

- Make sure the SOURCE selector is set to OFF and the crash lever is down.
- 2) If installed, remove the cargo net.
- 3) Remove intermediate seats refer to paragraph 1.D.
- 4) Remove the deflectors (34) maintained with Velcro-type strap.
- 5) If necessary, remove the cabin central carpet.

C - Cabin comfort - see figure 8.9.3

- 1) Remove blanking plugs (32) from their storage bag and install them on holes located forward the large door see figure 8.9.3 detail B.
- Remove blanking device assy (33) from the hot air outlet, located forward the large door, and store it into storage bag - see figure 8.9.3 detail A
- Remove blanking plugs (31) located in line with card table see figure 8.9.3 detail D, and install them on holes located in line with R.H. front side window - see figure 8.9.3 detail C.

D - Installation of cabinet

NOTE •

This operation must be carried out by a service center.

•

E - Installation of intermediate seats

- Install intermediate seats refer to paragraph 1 G.
- 2) If removed, install the baggage compartment partition net.
- 3) If removed, install cabin central carpet.

F - Installation of rear seats - see figure 8.9.1

- 1) Make sure the work area is clean and free from debris.
- 2) Clear the carpet from seat area to facilitate moving in rails.
- 3) Check that knobs (8) maintain locks (3) in up position.
- 4) Position the seat, fold it forward, refer to detail B, and insert pads (4) into rail (5) apertures.
- Move the seat so that locks (3) are in front of the color mark made on rail bottom.

Pilot's Operating Handbook

- 6) Pull up and hold L.H. and R.H. rings (2) and turn knobs (8) by 90° in order to insert locks (3) into rail (5) apertures.
- 7) Make sure the seat is correctly locked on rails (5).
- 8) Tilt seat forward, hold it and slip strap (9) around the locking control hinge pin. Screw quick links (7).
- 9) Tilt the seat rearward and lock it using seat tilting handle (1).
- 10) Fold up the backrest and lock it using backrest tilting handle (6).
- 11) Slide properly the carpet under the seat.
- 12) Remove protective covers.
- G Reconditioning
 - 1) Make sure the work area is clean and free from debris.
 - 2) Determine weight and balance refer to section 6.

3 - Additional configurations

▲ WARNING ▲

Removed seats can only be installed at their original location.

Rear seat (L.H. or R.H.) is the only one which can be installed in cabin axis, on both central rails – refer to section 7.

NOTE •

Many combinations of accommodations are authorized with seats (rear and intermediate) by pilot or service centers and cabinet(s) by service centers only. However, the pilot must ensure that he gets all necessary authorizations from his regulatory authority.

NOTE •

To remove or install these elements, use paragraph 1 or 2 – refer to table 1.

NOTE •

After these operations, determine weight and balance with the new C.G. - refer to section 6.

•

Equipment	Action	Description operation
Rear seat	Removal	Paragraph 1.C.

8.10 - Utilization by cold weather (- 0°C to - 25°C) or very cold weather (- 25°C to - 40°C)

NOTE •

Check pressure values in a hangar heated at about 15°C with control equipment at room temperature.

•

If a landing is foreseen by cold or very cold weather or in case of airplane prolonged operation in such conditions, it is recommended to prepare the airplane as follows:

- Smear with silicone grease the door and engine cowlings seals, as well as the leading edge deicers.
- 2 Apply engine oil on the engine cowling latches.
- 3 Inflate main landing gear shock absorbers to 247 psi (17 bars) at a room temperature of 15°C.
- 4 Position a 0.59 in (15 mm) shim at the bottom of the piston tube and against forward landing gear half-fork to reduce shock absorber travel. Refill with hydraulic liquid. Remove the shim and inflate shock absorber to 138 psi (9.5 bars) at a room temperature of 15°C.
- 5 Inflate main landing gear tires to 130 psi (8.96 bars) and nose tire to 102 psi (7 bars) at a room temperature of 15° C.

NOTE •

See table 1 hereafter to check pressure values and to inflate tires and shock absorbers.

•

Pilot's Operating Handbook

Check pressure values and inflate, if necessary, according to following table 1 during operation in cold weather only:

	OAT (°C)	- 40°	- 30°	- 20°	- 10°	+ 15°
r e s u r e	Main landing gear shock absorber	189 (13)	196 (13.5)	203 (14)	218 (15)	247 (17)
	Nose gear shock absorber	102 (7)	109 (7.5)	116 (8)	123 (8.5)	138 (9.5)
	Main landing gear tire	144 (9.96)	144 (9.96)	130 (8.96)	130 (8.96)	130 (8.96)
psi (bars)	Nose gear tire	94 (6.5)	94 (6.5)	102 (7)	102 (7)	102 (7)

15	L.H. and R.H. equipped control wheels : deletion of P/N
18	Addition of OPT/MOD70-0455-31A : Light weight Flight Data Recorder
19	Deletion of "Door actuator EC 6230"
21	OPT/MOD70-0322-00: addition of "LED" notion for taxi and landing lights
22	Lift transducer 799-13 : - addition of validity : Up to S/N 1105
22	Addition of OPT/MOD70-0423-34 : Lift transducer and AoA computer
25	OPT/MOD70-0270-34A: - addition of validity: Up to S/N 1105
25	Addition of OPT/MOD70-0451-34A : GRA 55 radar altimeter
26	OPT/MOD70-0176-00F: - addition of validity: Up to S/N 1110
26	OPT/MOD70-0258-00B: - addition of validity: Up to S/N 1110
27	OPT/MOD70-0176-00E: - addition of validity: Up to S/N 1110
27	Addition of OPT/MOD70-0264-34C : Transponder # 2 GTX 33 - Mode S diversity with extended squitter
27	OPT/MOD70-0176-00H: - addition of validity: Up to S/N 1110
28	OPT/MOD70-0176-00G: - addition of validity: Up to S/N 1110
29	OPT70-207-00 : - addition of "with oxygen masks EROS"

The following list contains standard equipment installed on each airplane and available optional equipment.

A separate list of equipment of items installed at the factory in your specific airplane is provided in your airplane file.

Columns showing weight (in pounds) and arm (in inches) provide the weight and center of gravity location for the equipment.

In the list of Required, Standard or Optional equipment (not restrictive), a letter "R", "S", "O" or "A" allows classifying the equipment:

- "R" : equipment items required for certification
- "S" : standard equipment items
- "A" : optional equipment items which are in addition to required or standard items
- "O" : optional equipment items replacing required or standard items

List of critical RVSM equipment

Equipment listed hereafter, or later approved versions, is required for RVSM operation.

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the TBM airplane is equipped with the option WX-500 stormscope.

Whenever this supplement refers to the WX-500 Pilot's Guide, it states the one described in section 2.

SECTION 2

Limitations

The limitations hereafter supplement or replace those of the standard airplane described in section 2 Limitations of the basic POH when the airplane is equipped with the option WX-500 stormscope.

The WX-500 stormscope systems signal displays are not intended for the purpose of penetrating thunderstorm areas or areas of severe turbulence; such intentional use is prohibited.

NOTE •

Range selection determines receiver sensitivity and therefore relative range. Displayed range is based on signal strength and is not to be used for accurate determination of thunderstorm location.

▲ CAUTION ▲

The stormscope must not be used for thunderstorm penetration.

The WX-500 Pilot's guide, Series II, No. 009-11501-001 and the GARMIN Integrated flight deck pilot's guide, as applicable, at their latest revision shall be readily available to the pilot, whenever the operation of the WX-500 stormscope is predicted.

SECTION 3

Emergency procedures

Installation and operation of WX-500 stormscope do not change the basic emergency procedures of the airplane described in section 3 Emergency procedures of the basic POH.

SECTION 4

Normal procedures

Normal operating procedures of the WX-500 stormscope are outlined in the WX-500 Pilot's Guide.

SECTION 5

Performance

Installation and operation of WX-500 stormscope do not change the basic performance of the airplane described in section 5 Performance of the basic POH.

SECTION 6

Weight and balance

The weight and balance hereafter supplement or replace those of the standard airplane described in section 6 Weight and balance of the basic POH when the airplane is equipped with the option WX-500 stormscope.

S/ R/ A/ O	Item OPT70 or MOD70	Required (R) or Standard (S) or Optional (A or O) equipment	Weight per unit lb (kg)	Arm in. (m)
		34 - NAVIGATION		
		• • • • • • • • • • • • • • • • • • • •		

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the airplane is equipped with the option WX-500 stormscope.

The WX-500 (series II) stormscope, weather mapping system provides a visual screen readout of the electrical discharges associated with thunderstorms. This information with proper interpretation, will allow the pilot to detect severe thunderstorm activity. A series of green dots or of strike points will be displayed on the screen to indicate the electrical discharge areas.

The WX-500 (series II) stormscope, weather mapping system interfaces with the integrated flight deck system.

SECTION 8

Handling, servicing and maintenance

Installation and operation of WX-500 stormscope do not change the handling, servicing and maintenance procedures of the airplane described in section 8 Handling, servicing and maintenance of the basic POH.

SUPPLEMENT Engine fire detection system

8	_	Handling, servicing and maintenance	9.18.7

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the airplane is equipped with the option Engine fire detection system.

The general hereafter supplement or replace those of the standard airplane described in section 1 General of the basic POH when the airplane is equipped with the option Engine fire detection system.

The fire detection system allows engine fire monitoring and indicating.

SECTION 2

Limitations

Installation and operation of Engine fire detection system do not change the basic limitations of the airplane described in section 2 Limitations of the basic POH.

SECTION 3

Emergency procedures

The emergency procedures hereafter supplement or replace those of the standard airplane described in section 3 Emergency procedures of the basic Pilot's Operating Handbook when the airplane is equipped with the option Engine fire detection system.

Α	0496-26A	Engine fire detection system L'HOTELLIER (From S/N 1106)	1.464 (0.66)	96.06 (2.440)

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic Pilot's Operating Handbook when the airplane is equipped with the option Engine fire detection system.

The engine fire detection system enables the monitoring and indication of a fire in the engine area.

The system includes:

- 7 detectors
- the test push-button
- the integrated flight deck system.

Detectors

The 7 detectors are secured on supports positioned in the most sensitive engine areas. They consist of thermal switches detecting a temperature greater than 200°C.

Push-button

The push-button enables the pilot to test the detection system by opening the grounding circuit. It is connected in series with the 7 detectors.

>> Up to S/N 1105, plus S/N 687

The FIRE TEST push-button is located on left side of left instrument panel.

>> From S/N 1106

The TEST push-button is located on upper panel.

Display

Refer to the GARMIN Integrated Flight Deck Pilot's Guide, as applicable, at its latest revision.

SECTION 8

Handling, servicing and maintenance

Installation and operation of Engine fire detection system do not change the basic handling, servicing and maintenance procedures of the airplane described in section 8 Handling, Servicing and Maintenance of the basic Pilot's Operating Handbook.

Intentionally left blank

7	-	Description	9.49.7
8	-	Handling, servicing and maintenance	9.49.14

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the airplane is equipped with the option GARMIN TAWS system.

The TAWS function enables to detect if the airplane path is in compliance with the overflown terrain relief.

SECTION 2

Limitations

The limitations hereafter supplement or replace those of the standard airplane described in section 2 Limitations of the basic POH when the airplane is equipped with the option GARMIN TAWS system.

The TAWS function provides terrain proximity alerting and detection to the pilot. It must not be used for airplane vertical and horizontal navigation.

<u>AC 2318 recommendation</u>: in order to avoid unwillingly warnings, TAWS function must be inhibited for any landing on a terrain which is not mentioned in the data base.

The use of the terrain awareness warning and terrain display functions is prohibited during QFE (atmospheric pressure at airport elevation) operations.

>> Airplane equipped with GARMIN flight deck as standard

The GARMIN Integrated Flight Deck Pilot's Guide mentioned in section 2 Limitations of the basic POH, as applicable, or any further edition applicable to the latter, shall be readily available to the pilot, whenever the operation of TAWS system is predicted.

>> Airplane retrofitted with GARMIN G1000 NXi flight deck (MOD70-0539-00)

The GARMIN G1000 NXi Integrated Flight Deck Pilot's Guide for the TBM850/900 P/N 190-02348-00 or any further edition applicable to the latter, shall be readily available to the pilot, whenever the operation of TAWS system is predicted.

SECTION 3

Emergency procedures

The emergency procedures hereafter supplement or replace those of the standard airplane described in section 3 Emergency procedures of the basic POH when the airplane is equipped with the option GARMIN TAWS system.

TAWS FAIL annunciation

The TAWS function is not operational.

SECTION 4

Normal procedures

The normal procedures hereafter supplement or replace those of the standard airplane described in section 4 Normal Procedures of the basic POH when the TBM airplane is equipped with the option GARMIN TAWS system.

Before takeoff

End of procedure.

4.1 - Warnings of the TAWS function

"PULL UP" voice alert

PULL UP PFD/MFD alert annunciation and PULL UP MFD pop-up alert light ON.

- 1 Level the wings.
- 2 TRQ Maximum
- 3 Choose the optimum rate of climb adapted to airplane configuration and speed, until the warning disappears.

End of procedure.

"Terrain Terrain, Pull up Pull up",
"Obstacle Obstacle, Pull up Pull up", voice alerts

PULL UP PFD/MFD alert annunciation and TERRAIN/OBSTACLE - PULL UP MFD pop-up alert light ON.

1 - Adjust airplane path in order to make the warning disappear.

End of procedure.

4.2 - Cautions of the TAWS function

"Caution terrain", "Caution obstacle", "Too low terrain" voice alerts

TERRAIN PFD/MFD alert annunciation and CAUTION TERRAIN/OBSTACLE

or **TOO LOW TERRAIN** MFD pop-up alerts light ON.

1 - Adjust airplane path in order to make the warning disappear.

End of procedure.

"Don't sink" voice alert

TERRAIN PFD/MFD alert annunciation and **DON'T SINK** MFD pop-up alert light ON.

1 - Re-establish a positive rate of climb.

End of procedure.

"Sink rate" voice alert

TERRAIN PFD/MFD alert annunciation and **SINK RATE** MFD pop-up alert light ON.

Reduce rate of descent.

End of procedure.

SECTION 5

Performance

Installation and operation of GARMIN TAWS system do not change the basic performance of the airplane described in section 5 Performance of the basic POH.

SECTION 6

Weight and balance

The weight and balance hereafter supplement or replace those of the standard airplane described in section 6 Weight and balance of the basic POH when the airplane is equipped with the option GARMIN TAWS system.

S/ R/ A/ O	Item OPT70 or MOD70	Required (R) or Standard (S) or Optional (A or O) equipment	Weight per unit lb (kg)	Arm in. (m)
		34 - Navigation		
Α	0176-00 Version F	TAWS system GARMIN	/	/

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the TBM airplane is equipped with the option GARMIN TAWS system.

>> Airplane with G3000 Flight deck (MOD70-0476-00)

TAWS-B terrain and obstacle alerts

- Alerts include visual annunciations and voice alerts.
- Alerts are accompanied by visual annunciation on PFD's and pop-up alerts on either Touchscreens Controllers
- Pilot acknowledges the Alert on the Touchscreen Controller

Voice alerts inhibiting

- TAWS Alerts can be inhibited by the pilot selecting Inhibit TAWS on Touchscreens Controllers
- Discretion should be used when inhibiting alerts and the system should be enabled when appropriate.

>> All

The TAWS function has 7 modes.

1. Forward Looking Terrain Avoidance alert

The Forward Looking Terrain Avoidance (FLTA) alert is used by TAWS and is composed of :

 Reduced Required Terrain Clearance and Reduced Required Obstacle Clearance

Reduced Required Terrain Clearance (RTC) and Reduced Required Obstacle Clearance (ROC) alerts are issued when the airplane flight path is above terrain, yet is projected to come within the minimum clearance values in table 9.49.1. When an RTC or ROC alert is issued, a potential impact point is displayed on the TAWS Page.

- Imminent Terrain Impact and Imminent Obstacle Impact

Imminent Terrain Impact (ITI) and Imminent Obstacle Impact (IOI) alerts are issued when the airplane is below the elevation of a terrain or obstacle cell in the airplane's projected path. ITI and IOI alerts are accompanied by a potential impact point displayed on the TAWS Page. The alert is annunciated when the projected vertical flight path is calculated to come within minimum clearance altitudes in table 9.49.1.

Phase of flight	Minimum Clearance Altitude Level Flight (ft)	Minimum Clearance Altitude Descending (ft)
Enroute	700	500
Terminal	350	300
Approach	150	100
Departure	100	100

Table 9.49.1 - Minimum Terrain and Obstacle Clearance values for FLTA alerts

During the final approach phase of flight, FLTA alerts are automatically inhibited when the airplane is below 200 feet AGL while within 0.5 Nm of the approach runway or below 125 feet AGL while within 1.0 Nm of the runway threshold.

The aural/displayed messages associated with the FLTA function are described in the table 9.49.2.

Alert Type	PFD/MFD TAWS Page Annunciation	MFD Map Page Pop-Up Alert	Aural Message
Reduced Required Terrain Clearance Warning (RTC) (Red)	PULL UP	TERRAIN - PULL UP	"Terrain, Terrain ; Pull up, Pull up"
Imminent Terrain Impact Warning (ITI) (Red)	PULL UP	TERRAIN AHEAD - PULL UP	"Terrain Ahead, Pull up ; Terrain Ahead, Pull up"
Reduced Required Obstacle Clearance Warning (ROC) (Red)	PULL UP	OBSTACLE - PULL UP	"Obstacle, Obstacle ; Pull up, Pull up"
Imminent Obstacle Impact Warning (IOI) (Red)	PULL UP	OBSTACLE AHEAD - PULL UP	"Obstacle Ahead, Pull up ; Obstacle Ahead, Pull up"
Reduced Required Terrain Clearance Caution (RTC) (Amber)	TERRAIN	CAUTION - TERRAIN	"Caution, Terrain ; Caution, Terrain"
Imminent Terrain Impact Caution (ITI) (Amber)	TERRAIN	TERRAIN AHEAD	"Terrain Ahead ; Terrain Ahead"
Reduced Required Obstacle Clearance Caution (ROC) (Amber)	TERRAIN	CAUTION - OBSTACLE	"Caution, Obstacle; Caution, Obstacle"
Imminent Obstacle Impact Caution (IOI) (Amber)	TERRAIN	OBSTACLE AHEAD	"Obstacle Ahead; Obstacle Ahead"

Table 9.49.2 - FLTA alerts

2. Premature descent alerting

A Premature Descent Alert (PDA) is issued when the system detects that the airplane is significantly below the normal approach path to a runway (Figure 9.49.1).

PDA alerting begins when the airplane is within 15 Nm of the destination airport. PDA alerting ends when the airplane is either:

0.5 Nm from the runway threshold

or

at an altitude of 125 feet AGL while within 1.0 Nm of the threshold.

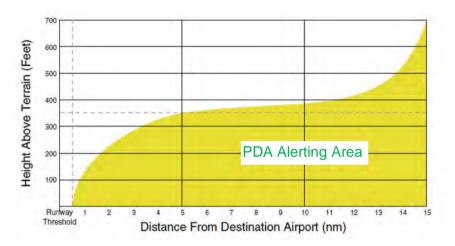

Figure 9.49.1 - PDA alerting threshold

The aural/displayed messages associated with the PDA function are described in the table 9.49.3.

Alert Type	PFD/MFD TAWS Page Annunciation	MFD Map Page Pop-Up Alert	Aural Message
Premature Descent Alert Caution (PDA) (Amber)	TERRAIN	TOO LOW - TERRAIN	"Too low, Terrain"

Table 9.49.3 - PDA alerts

3. Excessive descent rate alert

The purpose of the Excessive Descent Rate (EDR) alert is to provide suitable notification when the airplane is determined to be closing (descending) upon terrain at an excessive speed. Figure 9.49.2 shows the parameters for the alert as defined by TSO-C151b.

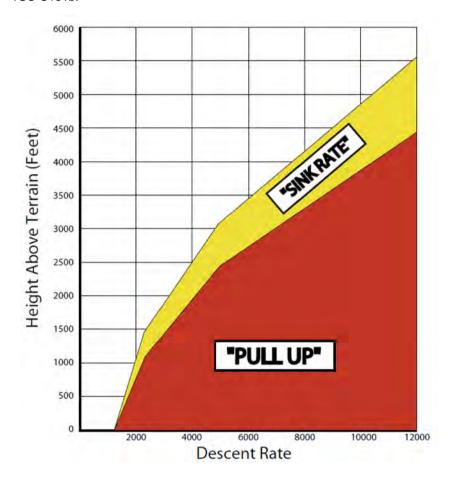

Figure 9.49.2 - Excessive Descent Rate Alert Criteria

The aural/displayed messages associated with the EDR function are described in the table 9.49.4.

Alert Type	PFD/MFD TAWS Page Annunciation	MFD Map Page Pop-Up Alert	Aural Message
Excessive Descent Rate Warning (EDR) (Red)	PULL UP	PULL UP	"Pull up"
Excessive Descent Rate Caution (EDR) (Amber)	TERRAIN	SINK RATE	"Sink rate"

Table 9.49.4 - EDR alerts

4. Negative climb rate after takeoff alert (NCR)

The purpose of the Negative Climb Rate (NCR) After Takeoff alert (also referred to as Altitude Loss After Takeoff) is to provide suitable alerts to the pilot when the system determines that the airplane is loosing altitude (closing upon terrain) after takeoff. The aural message "Don't sink" is given for NCR alerts, accompanied by an annunciation and a pop-up terrain alert on the PFD's and Touchscreen Controllers. NCR alerting is only active when departing from an airport and when the following conditions are met:

- The height above the terrain is less than 700 feet.
- The distance from the departure airport is 5 Nm or less.
- The heading change from the heading at the time of departure is less than 110 degrees.

Figure 9.49.3 shows two figures which illustrate the NCR alerting parameters as defined by TSO-C151b.

The NCR alert is issued when the altitude loss and height are within the range in the first figure, or when the sink rate (negative vertical speed) and height are within the range in the second figure.

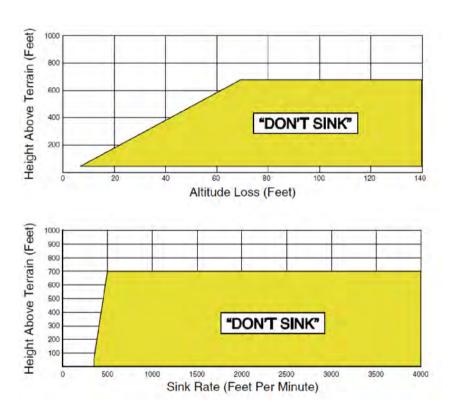

Figure 9.49.3 - Negative Climb Rate (NCR) Alert Criteria

The aural/displayed messages associated with the NCR function are described in the table 9.49.5.

Alert Type	PFD/MFD TAWS Page Annunciation	MFD Map Page Pop-Up Alert	Aural Message
Negative Climb Rate Caution (NCR) (Amber)	TERRAIN	DONT' SINK	"Don't sink"

Table 9.49.5 - NCR alerts

5. "FIVE-HUNDRED" aural alert, altitude voice callout (VCO)

The purpose of the aural alert message "Five-Hundred" is to provide an advisory alert to the pilot that the airplane is 500 feet above terrain. When the airplane descends within 500 feet of terrain, the aural message "Five-Hundred" is generated. There are no display annunciations or pop-up alerts that accompany the aural message.

6. TAWS not available alert

TAWS requires a 3-D GPS navigation solution along with specific vertical accuracy minimums. Should the navigation solution become degraded or if the airplane is out of the database coverage area, the annunciation TAWS N/A is generated in the annunciation window and on the TAWS Page. The aural message "TAWS Not Available" is generated. When the GPS signal is re-established and the airplane is within the database coverage area, the aural message "TAWS Available" is generated.

7. TAWS inhibit

TAWS also has an inhibit mode that deactivates the PDA/FLTA aural and visual alerts. Pilots should use discretion when inhibiting TAWS and always remember to enable the system when appropriate. Only the PDA and FLTA alerts are disabled in the inhibit mode.

SECTION 8

Handling, servicing and maintenance

Installation and operation of GARMIN TAWS system do not change the basic handling, servicing and maintenance procedures of the airplane described in section 8 Handling, Servicing and Maintenance of the basic POH.

SUPPLEMENT GARMIN Synthetic Vision System Table of contents

			Page
1	-	General	9.50.2
2	-	Limitations	9.50.2
3	-	Emergency procedures	9.50.3
4	-	Normal procedures	9.50.4
5	-	Performance	9.50.5
6	-	Weight and balance	9.50.5
7	-	Description	9.50.5
8	-	Handling, servicing and maintenance	9.50.6

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the TBM airplane is equipped with the option GARMIN Synthetic Vision System (SVS).

The SVS does not replace and is not intended to be used independently of the TAS and/or TAWS system(s).

The SVS does not replace and is not intended to be used independently of the horizontal and vertical primary flight instruments.

The SVS does not replace and is not intended to be used independently of the Course Deviation Indicator and the Vertical Deviation Indicator.

SECTION 2

Limitations

The limitations hereafter supplement or replace those of the standard airplane described in section 2 Limitations of the basic POH when the TBM airplane is equipped with the option GARMIN Synthetic Vision System.

The following document, or any further edition applicable to the latter, shall be readily available to the pilot, whenever operation of the SVS is predicted:

- >> Airplane equipped with G1000 Flight deck (MOD70-0176-00)
- GARMIN Integrated Flight Deck Pilot's Guide, No. 190-00709-05 or its latest revision.
- >> Airplane equipped with G1000 Nxi Flight deck (MOD70-0539-00)
- GARMIN Integrated Flight Deck Pilot's Guide, No. 190-02218-XX at its latest revision.
- >> Airplane retrofited with GARMIN G1000 NXi Flight deck (MOD70-0539-00)
- GARMIN G1000 NXi Integrated Flight Deck Cockpit Pilot's Guide for the TBM850/900 P/N 190-02348-00 or any later revision as applicable.
- >> Airplane equipped with G3000 Flight deck (MOD70-0476-00)
- GARMIN Integrated Flight Deck Pilot's Guide, No. 190-02046-XX at its latest revision.

The use of the Synthetic Vision System display elements alone for airplane control without reference to the GARMIN system primary flight instruments is prohibited.

The use of the Synthetic Vision System alone for vertical and/or horizontal navigation, or obstacle or terrain avoidance is prohibited.

Pathway boxes must be selected OFF when flying an instrument approach. Turn Pathways OFF when ACTIVATE VECTORS-TO-FINAL, ACTIVATE APPROACH is selected, or the airplane is established on any segment of the approach.

The use of the Synthetic Vision System traffic display alone to avoid other airplane is prohibited.

The Terrain Database has an area of coverage from North 75° latitude to South 60° latitude in all longitudes.

SECTION 3

Emergency procedures

The emergency procedures hereafter supplement or replace those of the standard airplane described in Section 3 Emergency Procedures of the basic Pilot's Operating Handbook when the TBM airplane is equipped with the option GARMIN Synthetic Vision System.

>> All

Use GARMIN system primary displays for navigation and airplane control.

SECTION 4

Normal procedures

The normal procedures hereafter supplement or replace those of the standard airplane described in section 4 Normal procedures of the basic POH when the TBM airplane is equipped with the option GARMIN Synthetic Vision System.

▲ CAUTION ▲

SVS information is not a subsitute for standard course and altitude deviation information provided by the CDI, VSI, VDI and the primary flight instruments, as well as for the Traffic Advisory System (TAS) or the Terrain Awareness Warning System (TAWS).

SVS activation

Refer to GARMIN Integrated Flight Deck Pilot's Guide, as applicable, listed in section 2 Limitations of this supplement for further information.

SECTION 5

Performance

Installation and operation of GARMIN Synthetic Vision System do not change the basic performance of the airplane described in Section 5 Performance of the basic POH.

SECTION 6

Weight and balance

The weight and balance hereafter supplement or replace those of the standard airplane described in Section 6 Weight and balance of the basic POH when the airplane is equipped with the option GARMIN Synthetic Vision System.

S/ R/ A/ O	Item OPT70 or MOD70	Required (R) or Standard (S) or Optional (A or O) equipment	Weight per unit lb (kg)	Arm in. (m)

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the airplane is equipped with the option GARMIN Synthetic Vision System.

SVS provides additional features on the primary flight display (PFD) - refer to GARMIN Integrated Flight Deck Pilot's Guide, as applicable, listed in section 2 Limitations of this supplement for further information.

SECTION 8

Handling, servicing and maintenance

Installation and operation of GARMIN Synthetic Vision System do not change the basic handling, servicing and maintenance procedures of the airplane described in section 8 Handling, servicing and maintenance of the basic POH.

SUPPLEMENT GARMIN GSR 56 weather datalink and satellite phone Table of contents

			Page

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the TBM airplane is equipped with the option GARMIN GSR 56 weather datalink and satellite phone.

SECTION 2

Limitations

The limitations hereafter supplement or replace those of the standard airplane described in section 2 Limitations of the basic POH when the TBM airplane is equipped with the option GARMIN GSR 56 weather datalink and satellite phone.

>> Airplane with G1000 or G1000 NXi Flight deck

Satellite phone functions

▲ WARNING ▲

Use of phone by PIC prohibited during all airplane operations

- It is forbidden to activate Pilot In Command On-side GMA TEL button as long as the airplane is in the air or moving on the ground.
- Only the Pilot In Command cross side GMA TEL input can be activated at all time of flight for the front passenger and passengers to have the GSR 56 telephone audio functions.

>> Airplane with G3000 Flight deck

Satellite phone functions

▲ WARNING ▲

Use of phone by PIC prohibited during all airplane operations

 Only the TEL button, on Copilot and Pass Tabs (located in NAV COM/Audio & Radios page) on GTC Touchscreens Controllers can be activated at all time of flight for the front passenger and passengers to have the GSR 56 telephone audio functions.

Supplement 56 GARMIN GSR 56 weather datalink and satellite phone

Pilot's Operating Handbook

>> All

Weather datalink functions

- The GSR 56 weather datalink is only an advisory weather source, it does not relieve the pilot to comply with the applicable operational regulation in terms of flight preparation especially with regard to the use of an approved weather and NOTAM sources during flight planning.
- >> Airplane equipped with GARMIN Flight deck as standard

The GARMIN Integrated Flight Deck Pilot's Guide mentioned in section 2 of the basic POH, as applicable, or any further edition applicable to the latter, shall be readily available to the pilot, whenever the operation of GSR 56 weather datalink and satellite phone system is predicted.

>> Airplane retrofitted with GARMIN G1000 NXi Flight deck (MOD70-0539-00)

The GARMIN G1000 NXi Integrated Flight Deck Pilot's Guide for the TBM850/900 P/N 190-02348-00 at its latest revision shall be readily available to the pilot whenever the operation of the GSR 56 weather datalink and satellite phone system is predicted.

International telecommunication regulation

The GSR 56 is a telecommunication device approved under FCC ID Q639522B and registered by the ITU (International Telecommunication Union) for international use according to the GMPCS-MoU.

The receiver transmitter RF module embedded in the GSR 56 is a 9522 B manufactured by Iridium Satellite LLC.

Terms of use are subject to changes and are available from the ITU website.

		23 - Communication		
Α	0331-23	Weather datalink and satellite GARMIN phone system GSR 56	3.82 (1.736)	58.03 (1.474)

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the airplane is equipped with the option GARMIN GSR 56 weather datalink and satellite phone.

GARMIN GSR 56 weather datalink and satellite phone system provides airborne low speed datalink and voice communication capability to Integrated Flight Deck system excluding any voice mail function. GSR 56 weather datalink and satellite phone system contains a transceiver that operates on the Iridium Satellite network.

The weather information are displayed on the MFD maps and on the PFD inset map.

>> Airplane with G1000 or G1000 NXi Flight deck

The satellite phone interface is embedded in the MFD: Phone communication and SMS can be received and sent through the dedicated pages on the MFD.

- The controls for the MFD are located on both the MFD bezel and the MFD control unit.
 - >> Airplane with G3000 Flight deck

The satellite phone interface is embedded in the Touchscreens Controllers: Phone communication and SMS can be received and sent through the dedicated pages on the Touchscreens Controllers.

>> All

Although it is possible to leave a message when calling the airplane, as voice mail communication is not supported by the GSR 56:

- it is not possible to access the GSR 56 voice mail from the airplane
- there is no indication on the Integrated Flight Deck system when a new message has been left on the GSR 56 voice mail.
- >> Airplane with G1000 or G1000 NXi Flight deck

The telephone audio including the incoming call ringing is controlled by the TEL button on the GMA audio panels and can be played in the pilot, front passenger and passengers headphones.

>> Airplane with G3000 Flight deck

The telephone audio including the incoming call ringing is controlled by the Touchscreens controllers & GMA audio processor and can be played in the pilot, front passenger and passengers headphones.

SECTION 8

Handling, servicing and maintenance

Installation and operation of GARMIN GSR 56 weather datalink and satellite phone. do not change the basic handling, servicing and maintenance procedures of the airplane described in section 8 Handling, Servicing and Maintenance of the basic POH.

SECTION 1

General

This supplement is intended to inform the pilot about the airplane specifics, among others those required by the relevant Certification Authorities (limitations, description and operations necessary to the operation of the TBM airplane).

SECTION 2

Limitations

The limitations hereafter supplement or replace those of the standard airplane described in section 2 Limitations of the basic POH.

2.5 - Weight and C.G. limits

Weight limits

- >> With 4-seat accommodation
- in rear part of pressurized cabin: 396 lbs (180 kg), with small or large net (see sketch below)

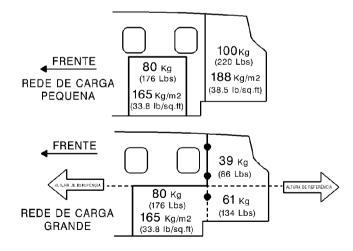

Figure 2.5.1 - Baggage limits

2.6 - Operation limits

When operating the VHF-COMM system in Brazilian air space, the selection of 8.33 kHz in the channels spacing can cause the loss of communication with the Air Traffic Control (ATC).

GNSS (GPS/SBAS) navigation system limitations

In accordance with Brazilian IS 21-013A, use of GNSS/GPS is prohibited under IFR unless other means of navigation, suitable and approved for the intended route, are installed and operational. It must be possible - at any point along the route - to navigate to the destination or alternate, using such means.

The SBAS functionality is not available in Brazil, therefore operations that require such functionality, such as GNSS vertical navigation modes, are prohibited in Brazilian airspace.

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the airplane is equipped with ADS-B OUT function.

The ADS-B OUT function is integrated in the optional modifications:

- MOD70-0264-34: Garmin GTX 33 Non-Diversity or diversity Mode S transponders with the extended squitter functionality,
- MOD70-0542-34: Garmin GTX 3X5 transponders.

The installed ADS-B OUT system has been shown to meet the equipment requirements of 14 CFR 91.227.

1.4 - abbreviations and terminology

Radio-navigation abbreviations

ADS-B : Automatic Dependent Surveillance-Broadcast

SECTION 2

Limitations

Operation of ADS-B OUT function does not change the limitations of the airplane described in section 2 Limitations of the basic POH.

SECTION 3

Emergency procedures

Operation of ADS-B OUT function does not change the emergency procedures of the airplane described in section 3 Emergency procedures of the basic POH.

SECTION 4

Normal procedures

Operation of ADS-B OUT function does not change the normal procedures of the airplane described in section 4 Normal procedures of the basic POH.

SECTION 5

Performance

Operation of ADS-B OUT function does not change the basic performance of the airplane described in section 5 Performance of the basic POH.

SECTION 6

Weight and balance

Operation of ADS-B OUT function does not change the basic weight and balance of the airplane described in section 6 Weight and balance of the basic POH.

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the airplane is equipped with the ADS-B OUT function.

The ADS-B OUT function enables the airplane to broadcast data, such as position information, to ground stations and to other airplanes equipped with ADS-B IN system.

The loss of an interfaced input to the selected extended quitter transponder may cause the transponder to stop transmitting ADS-B OUT data. Depending on the nature of the fault or failure, the transponder may no longer be transmitting all of the required data in the ADS-B OUT messages.

>> Airplane equipped with one extended squitter transponder

ADS-B OUT data is only transmitted via transponder 1. Use of transponder 2 results in a loss of the ADS-B OUT data transmission.

If the transponder 1 detects any internal fault or failure with the ADS-B OUT functionality, XPDR1 ADS-B FAIL message will be displayed.

After being informed of ADS-B OUT failure either by XPDR1 ADS-B FAIL message or by Air traffic Control, it is possible to disable ADS-B OUT function by selecting transponder 2 (if installed).

>> Airplane equipped with two extended squitter transponders

ADS-B OUT data can be transmitted from any transponder upon pilot selection.

If the transponder 1 [2] detects any internal fault or failure with the ADS-B OUT functionality, XPDR1 ADS-B FAIL [XPDR2 ADS-B FAIL] message will be displayed.

After being informed of ADS-B OUT failure either by XPDR1 ADS-B FAIL [XPDR2 ADS-B FAIL] message or by Air traffic Control, it is possible to restore ADS-B OUT function by selecting transponder 2 [1].

SECTION 8

Handling, servicing and maintenance

Operation of ADS-B OUT function does not change the basic handling, servicing and maintenance of the airplane described in section 8 Handling, servicing and maintenance of the basic POH.

SECTION 1

General

This supplement is intended to inform the pilot about the equipment limitations, description and operations necessary for operation when the airplane is equipped with Flight envelope protection.

The flight envelope protection may be:

- Option No. 1: the Lift Transducer, USP and coupled Go Around.
- Option No. 2: the Electronic Stability Protection, only if the option No. 1 is installed.
- Whenever this Supplement refers to the GARMIN Integrated Flight Deck Cockpit Reference Guide, it states the ones described in Section 2.

4.5 - Particular procedures

Flight into known icing conditions

▲ CAUTION ▲

The stall warning system does not function properly in icing conditions and should not be relied upon to provide adequate stall warning in icing conditions and after leaving icing conditions, if ice accretion remains on the airplane.

Therefore the USP and ESP, if installed, functions receiving information from the stall warning system may not be correctly engaged.

SECTION 5

Performance

Operation of Flight envelope protection does not change the basic performance of the airplane described in section 5 Performance of the basic POH.

SECTION 6

Weight and balance

>> From S/N 1000 to S/N 1105, plus S/N 687

Information hereafter supplement or replace those of the standard airplane described in section 6 Weight and Balance of the basic POH when the airplane is equipped with the Flight envelope protection.

S/ R/ A/ O	Item OPT70 or MOD70	Required (R) or Standard (S) or Optional (A or O) equipment	Weight per unit lb (kg)	Arm in. (m)

Figure 7.8.3 - Partial electrical distribution of bus bars

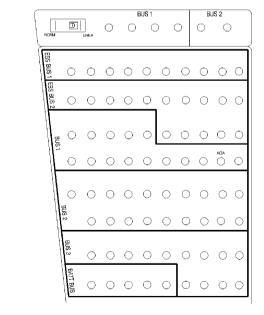

Figure 7.8.4 - Partial circuit breaker panel (typical arrangement)

4255004AAANMA18400

7.14 - Miscellaneous equipment Stall warning system

The stall warning system consists of :

- an electrically deiced lift transducer, installed in the leading edge of the right wing,
- an AoA computer,
- >> From S/N 1000 to S/N 1105, plus S/N 687
- the AOA TEST pushbutton located at the bottom of the L.H. side instrument panel.
- >> From S/N 1106
- AOA TEST function is integrated in the TEST push-button on cockpit overhead panel.
- >> All
- The system is also interfaced with the GARMIN flight deck.

The lift transducer is fitted with a vane that senses the change in airflow over the wing.

The AoA computer computes the normalized angle of attack of the airplane thanks to the lift transducer information and the flaps position. The normalized angle of attack value is sent to the GARMIN flight deck for display. The AoA computer also triggers the stall aural warning alert that begins no later than 5 knots above the stall in all configurations.

>> From S/N 1000 to S/N 1105, plus S/N 687

The stall warning system should be ckecked during the preflight inspection by momentarily turning on the SOURCE selector and by manipulating the vane of the lift transducer at the wing leading edge then, while in the cockpit by depressing the AOA TEST pushbutton.

>> From S/N 1106

The stall warning system should be ckecked during the preflight inspection by momentarily turning on the SOURCE selector and by manipulating the vane of the lift transducer at the wing leading edge then, while in the cockpit by depressing the TEST pushbutton on cockpit overhead panel.

>> All

The system is operational if a stall aural warning alert is heard on the alarms speaker.

For further information concerning the use of the system and its controls, refer to GARMIN Pilot's quide at the latest issue.

Underspeed protection (USP), coupled go around

For further information concerning the use of the system and its controls, refer to GARMIN Pilot's guide at the latest issue.

Electronic stability protection (ESP)

For further information concerning the use of system and its controls, refer to GARMIN Pilot's guide at the latest issue.

SECTION 8

Handling, servicing and maintenance

Operation of Flight envelope protection does not change the basic handling, servicing and maintenance of the airplane described in section 8 Handling, Servicing and Maintenance of the basic POH.

Intentionally left blank

Other procedures in the basic POH are unchanged.

SECTION 4

Normal procedures

The normal procedures hereafter supplement or replace those of the standard airplane described in section 4 Normal procedures of the basic POH when the TBM airplane is equipped with the option lavatory compartment.

BRIEFING to passengers to be performed before entering the airplane

Normal and Emergency stowing operations of the divider.

In case of depressurization: emergency stowing of the divider, use oxygen mask, and remain seated unless otherwise instructed by the crew.

The headset must be used when the divider is deployed to allow communication with the crew in case of emergency.

Edition 1 - November 16, 2016

Page 9.63.5

SECTION 5

Performance

Installation and operation of Lavatory compartment do not change the basic performance of the airplane described in section 5 Performance of the basic POH.

SECTION 6

Weight and balance

The weight and balance hereafter supplement or replace those of the standard airplane described in section 6 Weight and balance of the basic POH when the airplane is equipped with the option lavatory compartment.

6.1 - General

This paragraph is intended to provide the pilot with a simple and rapid means of determining weight and balance of the airplane when equipped with the lavatory compartment option.

▲ WARNING ▲

It is the pilot's responsibility to ensure that the airplane is properly loaded and the weight and balance limits are adhered to.

6.4 - Determining the new airplane empty weight and balance after the application of the lavatory compartment option

NOTE •

The new empty weight determination after lavatory compartment installation shall be performed from the 6-seat configuration airplane characteristics

•

- Record the basic empty weight (1a) and moment (1b) and CG (MAC %) (1c) from the last Weight and Balance Report in 6-seat configuration (see samples Figures 6.4.1 and 6.4.2 of the basic Pilot's Operating Handbook).
- Compute the new empty weight (2a) and moment (2b) as sum of all above weights (1a) [removed equipment + installed equipment] and associated moments (1b) [removed equipment + installed equipment]
- Compute the new empty weight arm (3) and CG (MAC %) (3c) using given formulas.

4) Report the new empty weight arm (3) and CG (MAC %) (3c) into the WEIGHT AND BALANCE FORM AND DIAGRAM of the airplane loading form in order to perform the weight and balance determination with the lavatory compartment installed.

>> Up to S/N 1159

Moment = Weight x Arm
$$CG (MAC \%) = \frac{(Arm (m) - 4.392)}{1.51} \times 100$$

lia	Weight	Arm	Moment	CG

SECTION 7

Description

Information hereafter supplement or replace those of the standard airplane described in section 7 Description of the basic POH when the airplane is equipped with the option Lavatory compartment.

For operation, refer to equipment User's Guide.

The lavatory compartment is installed against right interior upholstery panel, facing large door. The lavatory compartment is installed at the place of the rear seats, removed to allow this installation. It is attached to the fuselage structure on the cabin floor, using the seats tracks with four pads and screws.

The lavatory compartment structure is made of composite panels.

The lavatory compartment assembly is composed of :

- A chemical toilet,
- Electrically deployable separating panels (divider),
- Two (2) actuating switches (DEPLOY, STOW),
- Two (2) emergency stowing buttons (PUSHTO STOW), accessible from inside or outside the lavatory compartment,
- One (1) mirror,
- One (1) electric power plug,
- One (1) headset allowing communication between the passenger and the crew.

When the lavatory compartment is not occupied, the divider is stored unfolded in the lavatory compartment structure.

A breaker integrated into the lavatory compartment structure protects its electrical system. The circuit breaker is only accessible when the lavatory compartment is removed.

Two (2) switches, located on the seat front face, left side, hidden when latching strap snap fastener is locked, control the deployment/stowing of the moveable parts of the divider.

Two (2) access doors (Velcro tape attached), located on each side of the fixed part of the divider, give access to the emergency stowing push button, allowing the emergency (manual) retraction of the divider, using the application of a vertical force (by hand) on the upper edge of the divider.

Electric connection of the system is performed via a power plug:

- >> Without optional 12V power plugs (Pre-MOD70-0174-25)
 - 28 volts
- >> With optional 12V power plugs (Post-MOD70-0174-25)
 - 12 volts
 - >> All

The power plug is located on the right hand side upholstery panel. Connection is only accessible when the lavatory compartment structure is unscrewed from the floor and moved slightly aside to access the plug.

Mirror is automatically illuminated during the deployment of the divider.

A safety anti pinching sensor stops the deployment of the divider in case an interference is detected

To remove the chemical toilet system from the lavatory compartment structure, it is necessary to unlatch the toilet cover, remove the top frame, if installed then lift upward the forward face of the structure and pull out the toilet from the structure.

A storage volume on the left side of the toilet is accessible when toilet cover is up.

A magazine rack is located on the forward side of the fixed part of the divider.

SECTION 8

Handling, servicing and maintenance

Installation and operation of Lavatory compartment do not change the basic handling, servicing and maintenance procedures of the airplane described in section 8 Handling, servicing and maintenance of the basic POH.
